

Network structure of inter-industry flows

[James McNerney](#), [Brian D. Fath](#), [Gerald Silverberg](#)

(Submitted on 18 Apr 2012)

We study the structure of inter-industry relationships using networks of money flows between industries in 20 national economies. We find these networks vary around a typical structure characterized by a Weibull link weight distribution, exponential industry size distribution, and a common community structure. The community structure is hierarchical, with the top level of the hierarchy comprising five industry communities: food industries, chemical industries, manufacturing industries, service industries, and extraction industries.
