

## Roofing contractors

Posted by [admin](#) on 23 Jan 2008 | Tagged as: [roofing contractors](#)

Finally! A site to help you find a roofing contractor. If you are looking at making a big ticket item purchase, then it's definitely time to shop around, meet lots of different potential [roofing contractors](#) before you make that decision. As they say, act in haste repent at leisure. Use the time you spend meeting contractors not just to give them the information they need to give you a price, but to get a feel for them and ask the really important questions like ... who are you customers, and what work did you do on their roof. A happy customer, will always be pleased to talk to a prospective customer, while the same could be said of an unhappy customer, it's unlikely the roofing contractor will want you to make that link, shop around, ask lots of questions and decide the factors to make your decision.

## Getting Pregnant - Planning the right time

Posted by [admin](#) on 05 Nov 2007 | Tagged as: [Uncategorized](#)

Still, there are techniques that are performed that increase the likelihood that artificial insemination will lead to getting pregnant. Doctors that perform artificial inseminations will usually prescribe fertility boosting drugs for the woman wishing to undergo the procedure. These drugs, which should be begun at the beginning of the menstrual cycle, will pump up the fertile portion of a woman's cycle, often causing the release of more than one egg into the uterus. During a normal cycle, a woman will release only one. By causing the release of more eggs, the chances to [get pregnant](#) are increased because the sperm have a greater chance of finding an egg inside the uterus.

To determine exactly what part of her cycle a woman who wishes to undergo artificial insemination is in, an ultrasound will be performed at the outset. This is

to determine when a woman should start the treatment of fertility enhancing drugs for maximum effectiveness. Once the drugs have been started, continued ultrasounds will be performed so that the doctor can determine when the eggs are released into the uterus, which is the most fertile point of a woman's menstrual cycle. Once that happens, insemination should occur immediately.

## BIG TV Screens

Posted by [admin](#) on 04 Nov 2007 | Tagged as: [Uncategorized](#)

Though the idea of having LCD screens during your event sounds nice, your probably wondering how this would seem feasible? Well there are many services that specialize in proving top quality LCD screens for just such a purpose. Such a service that I would recommend would be Big TV. Big TV is a company that was designed with you the customer in mind. They offer a wide variety of display options that will undoubtedly meet and exceed your needs. They can handle a great deal of the aspects involved with the event besides just providing the LCD Screens, they can take care of staging, recording and production if need be. [Big TV](#) are the go to guys for getting your viewing experience up to par.

When dealing with serious events, your going to need a company that is dedicated to providing the best service at an affordable price. Big TV makes it their business to provide you with unrivaled service and great attention to detail. You can find more information on how to contact Big TV through their website <http://www.big-tv.co.uk>. The website gives information regarding what kinds of services they offer and how easily you can get in contact with them. Big TV is a serious company that has been around for years and has proven it's reputation by providing excellent service. I recommend getting in touch with them the next time you need an [LED screen display](#).

## Wigs

Posted by [admin](#) on 03 Nov 2007 | Tagged as: [Uncategorized](#)

When it comes to hair products we women are naturally the target for the market. We spend much of our time on perfecting our appearances so it is no doubt that we are the gender that knows the ins and outs of the hair industry. Women are very fashionable and love to get the latest and greatest hair styles, but going to the beauty salon or getting friends do your hair can become costly. No only does this routine get expensive, it also takes a lot of time. Making sure your hair is just right and having the perfect style is important, but one major hair solution or alternative that is often over looked or avoided is the purchase of a wig. In today's modern age buying synthetic hair or a wig has become a more and more important aspect of our lifestyle. Buying wigs can be an easy and wonderful experience. The Internet is a great place to view a wide variety of different wig designs and styles.

One of my favorite places to purchase wigs is <http://www.voguewigs.com>. This website has a simple yet easy to navigate through design, and is a website that can be trusted. They have an incredibly large selection of wig. The wigs on the website are made of high quality materials and will definitely be able to suit your needs. Voguewigs has wigs that are short, long, and in a wide variety of

## Insemination Methods

Posted by [admin](#) on 28 Sep 2007 | Tagged as: [Uncategorized](#)

Artificial insemination was developed to treat certain types of infertility. It involves manually introducing sperm into the reproductive tract of a woman in order to help her [get pregnant](#). It's particularly useful if a man is unable to ejaculate during sexual intercourse or has sperm with low motility which might be unable to reach the egg after intercourse. It has also been used for women with thick cervical mucus which hinders the passage of sperm. It is the method

of choice for inseminating a surrogate mother if she is relying on using her own fertilized eggs rather than having an embryo implanted in her uterus.

The sperm can be either fresh or frozen-thawed. The latter is strongly recommended because the processes involved in freezing minimize the chance that infectious microorganisms will be present.

The procedure must be timed to coincide with ovulation, whether this occurs naturally or is stimulated by hormone treatment. The most accurate way to determine the onset of ovulation is to monitor hormone levels in blood or urine; this gives better results than monitoring body temperature or vaginal discharge.

There are several methods of insemination; the success rate for most of them is around 15 to 30%.

1. Intrauterine insemination (IUI). IUI involves introducing sperm directly into the uterus via a catheter. This is an invasive method but has a higher success rate. Washed sperm must be used to avoid uterine cramping due to prostaglandins in unprocessed semen. IUI tends to be more successful if used in combination with fertility drugs, although several cycles are often needed before the woman gets pregnant.

2. Intracervical insemination (ICI). ICI is less expensive and invasive than IUI and also has good success rates. Because the sperm are deposited in the cervix rather than the uterus, they must be motile, so this method is unsuitable for infertility due to low-motility sperm. Sperm washing increases the chance of a successful outcome.

3. Intravaginal insemination (IVI). IVI is the simplest insemination technique and involves introducing sperm into the vagina, as is done during normal intercourse. It is not normally necessary to use washed sperm unless there is a known risk of infection from the semen. Since the sperm have to swim to the uterus, they must be motile.

4. Intrauterine insemination (ITI). ITI is an uncommon and highly invasive (and expensive) method. Since sperm are deposited directly in the fallopian tubes, close to where the eggs are located, the success rate tends to be higher than for the other techniques. This technique can be performed if IUI is unsuccessful.

5. Intrafollicular insemination (IFI). IFI involves introducing sperm directly into the ovarian follicles where the eggs are developing. This is a very invasive procedure and does not have an especially high success rate. It appears to have no advantages over IFI.

After the insemination procedure, the woman should remain lying down for a few minutes; she can then resume normal activity. If the procedure does not result in pregnancy, it can be repeated. If pregnancy does not result after six treatments, further medical consultation is advisable.

## Sperm Washing

Posted by [admin](#) on 28 Sep 2007 | Tagged as: [health](#)

Sperm washing is a technique to prepare sperm for use in artificial [insemination](#). Whether they are to be frozen or not, sperm should be subjected to this

process. During the sperm-washing process, sperm are separated from the seminal fluid and from other constituents of semen such as chemicals and microorganisms. Some of the sperm-washing techniques also allow live sperm to be separated from dead or deformed sperm, a step which greatly increases the likelihood of a successful outcome of the insemination procedure.

Washed sperm are needed for intrauterine [insemination](#) of women hoping to get pregnant, because unprocessed semen contains prostaglandins which may cause severe cramping if the semen is introduced directly into the uterus. The washing process also removes bacteria and viruses from the sperm and helps avoid infections in the woman and even in the resulting child. As a result of the success of sperm washing in removing viruses, it's now a real possibility for an HIV-positive man to have a child with an HIV-negative woman without risking that she and the child will be infected.

There are three main sperm-washing techniques, and the choice of technique depends on the type of sperm contained in the semen to be treated.

1. The swim-up method. This technique is suitable for normal semen samples. The semen sample is placed in a test tube and covered with a layer of washing medium. Sperm, which tend to swim upward, swim up into the medium, leaving behind the seminal fluid and dead sperm which are unable to swim. Only sperm which are sufficiently healthy and motile to swim up into the washing medium are collected, so this technique results in a high-quality sample. After being collected, the medium is centrifuged to concentrate the sperm, which are separated from the medium and then prepared for storage.

2. The centrifugation method. This method is used for semen samples containing sperm with low motility and for samples with a low sperm count. Low-motility sperm are less likely to be able to swim up into the washing medium without help, so the swim-up method is not suitable for sperm collection in this case. In the centrifugation method, the semen sample is mixed with the washing medium, and the mixture is centrifuged until the sperm separate out as a pellet. The pellet is collected from the centrifuged sample, suspended in more medium, and centrifuged again. This step can be repeated several times to ensure a pure sample.

3. The density gradient method. This is another centrifugation method, which is suitable for highly viscous samples and those with abnormal cells and debris. Washing media of different densities are layered in a tube, and the semen is added on top. Viable sperm are separated into the pellet after centrifugation, whereas the abnormal cells and debris are trapped in the different layers of medium. As with the regular centrifugation method, the density gradient process is repeated several times to ensure that the pellet eventually contains a pure sample.

Sperm samples are analyzed by the lab for abnormalities both before and after the washing process. The sperm-washing process thus results in a high-quality sperm sample with a good chance of successfully and safely fertilizing the eggs of a woman wishing to get pregnant.
