[ 关键词 ] "Space on Earth" specifically ecosystems

Most who choose between humans and Earth? Space enthusiasts often divide environmentalists as being too inward-looking and focused on the past, with their fight to preserve Earth's ecosystems and natural resources in the face of humanity's push for development. Likewise, those concerned about Earth's problems often look askance at space enthusiasts as being too outward-looking and focused on the future.

Yet in his book, "Space on Earth," microbiologist Charles Cockell urges the seemingly disparate disciplines of space and environmental science share common goals, and both will be better served by joining forces.

In its introduction, Cockell writes, "It is the environmentalists who regard space exploration as a waste of money, an activity that draws off resources which we should be solving problems at home." Cockell writes, "On the other hand, I know no space scientist who regards environmentalists as Luddites, passing inwards to the bounds of Mother Earth and lacking the vision to look outwards to the endless resources and opportunities in space. These perceive

In this book excerpt, Cockell explains why humanity has only a brief period of time – and of the incredibly long history of life on our planet – to set aside such superficial differences and prepare for a secure future on Earth and in space.
