A CLASS OF MULTISTEP INTERPOLATION METHODS FOR SOLVING STIFF ORDINARY DIFFERENTIAL EQUATIONS & PARALLEL IMPLEMENTATION

Liao Wen-yuan; Li Qing-yang(Dept. of Applied Mathematics Of Tsinghua University)

Abstract:

In this paper, we combine implicit RK method with implicit linear multistep method to propose a class of multistep interpolation methods which make use of the derivatives at the point of $t-k+j$ ($j = 1, 2, \dots, k-1$) and base on general multistep ax method proposed in [1]. By choosing free parameters in these methods we can make them stable, parallel. The other advantages are their high orders and less computation. Numerical experiments show that these methods are more efficient in solving stiff ODEs than implicit ax method, implicit linear multistep method and multistep RK method.
