Bollobás and P. Erdős (1976) 提出了如下猜想: 若 $\Delta_{\text{mon}} < \lfloor \frac{n}{2} \rfloor$, 则 K_n^c 中含有一个正常染色的Hamilton圈. 这个猜想至今还未被证明. 我们研究了上述条件下的正常染色的路和圈.

关键词: 正常染色圈 完全图

Abstract: Let K_n^c denote a complete graph on n vertices whose edges are colored in an arbitrary way. Let Δ_{mon} $(K_n^c)^{\Delta_{\text{mon}}}$ denote the maximum number of edges of the same color incident with a vertex of K_n^c . A properly colored cycle (path) in K_n^c is acycle (path) in which adjacent edges have distinct colors. B. Bollobás and P. Erdős (1976) proposed the following conjecture: If $\Delta_{\text{mon}} < \lfloor \frac{n}{2} \rfloor$ $(K_n^c)^{\Delta_{\text{mon}}} < \lfloor \frac{n}{2} \rfloor$, then K_n^c contains a properly colored Hamiltonian cycle. This conjecture is still open. In this paper, we study properly colored paths and cycles under the condition mentioned in the above conjecture.

Keywords: properly colored cycle, complete graph
