THEMATIC SEMESTER

Thematic Semester: Risk in complex systems - Models, applications, perceptions, and policy implications, August-December 2017

Overview

[Français]

Risk analysis is a critical part of the design, implementation and assessment of medical research and healthcare provision and development. It plays an active role from the design of clinical trials in drug development, to the surveillance of outcomes, and to the assessment of risk to health from environmental, occupational

The workshop will address aspects of quantification and mitigation of risk in health science, including the modeling and analysis of occupational and environmental health, mitigation of risk in assessment in trial design for toxicity and efficacy in Phase II/III clinical trials, and the use of risk in post-market surveillance. Statistical methods which will be discussed in this context include Bayesian methods, design and personalized treatment strategies.

Students and postdoctoral fellows are encouraged to present a poster at the workshop, or to give a short lightning talk, so that trainees can introduce themselves and their work to the workshop.

Limited student travel grants are available. Apply early.

FINANCIAL SUPPORT

Applications are closed.

Deadline: November 10, 2017

POSTER SUBMISSION

Poster submissions are closed.

Deadline: November 10, 2017

INVITED SPEAKERS

See list
