摘要: 通过溶胶-凝胶法制备出不同Tb³⁺掺杂浓度和不同二次煅烧温度下的ZnAl₂O₄: Tb³⁺荧光粉, 并利用X射线衍射(XRD)和荧光光谱等对样品进行了表征。由XRD结果可知, 当Tb³⁺掺杂的摩尔分数不大于9%, 二次煅烧温度在600℃以上时, 所得粉体为结晶性良好的尖晶石相。在紫外光激发下, ZnAl₂O₄: Tb³⁺荧光粉的发射光谱由位于488 nm(⁵D₄→⁷F₆)、542 nm(⁵D₄→⁷F₅)、587 nm(⁵D₄→⁷F₄)和621.5 nm(⁵D₄→⁷F₃)的4个发射峰组成。研究发现, Tb³⁺的掺杂浓度和二次煅烧温度对样品发光强度有着重要影响, 当Tb³⁺的摩尔分数为5%、二次煅烧温度为900℃时, ZnAl₂O₄: Tb³⁺荧光粉的发光最强, 继续增加Tb³⁺掺杂浓度或提高煅烧温度, 分别会出现浓度猝灭和温度猝灭现象。

Abstract: The ZnAl₂O₄: Tb³⁺ phosphor powders were synthesized by sol-gel method with different doping concentrations of Tb³⁺ and secondary calcination temperatures. Then they were characterized by X-ray diffraction (XRD) and photoluminescence (PL). The XRD patterns show that the pure spinel phase of high crystallinity can be obtained when the mole fraction of Tb³⁺ is less than 9% and the secondary calcination temperature exceeds 600℃. Under the excitation of ultraviolet light, the emission spectra of ZnAl₂O₄: Tb³⁺ phosphor consists of four peaks locating at 488 nm(⁵D₄→⁷F₆), 542 nm(⁵D₄→⁷F₅), 587 nm(⁵D₄→⁷F₄), and 621.5 nm(⁵D₄→⁷F₃)。The influence of Tb³⁺ concentration and secondary calcination temperature on the luminescence intensity was significant. The photoluminescence spectra intensity of ZnAl₂O₄: Tb³⁺ is the strongest when the mole fraction of Tb³⁺ is 5% and the secondary calcination temperature is 900℃. When the mole fraction of Tb³⁺ and the secondary calcination temperature increase excessively, concentration quenching and temperature quenching appear, respectively.

Keywords: ZnAl₂O₄ Tb³⁺ phosphor structure photoluminescence
