摘要:

研究了磁光耦合强度对磁光光纤布拉格光栅中模式转换光反射光谱特性的影响。根据磁光耦合模理论并结合光纤布拉格光栅的传播特性,数值分析了磁光光纤布拉格光栅的磁控特性,得到了3dB带宽可调的滤波器。采用级联磁光光纤布拉格光栅构造磁控梳状滤波器,实现了40Gbps归零数据信号的全光时钟提取仿真,分析了时钟信号的抖动性能与磁光耦合参量的关系。

关键词: 全光时钟提取 磁光光纤布拉格光栅 可调梳状滤波器

Performance of Magneto-optic Fiber Bragg Grating Filters for All-Optical Clock Extraction

Abstract:

The reflection spectra of polarization-mode converted light in magneto-optic fiber Bragg gratings (MFBGs) dependent on the magneto-optical coupling intensity is investigated. According to the magneto-optic coupled-mode theory combined with the propagation property of fiber Bragg grating, the magnetic control characteristics of the MFBGs are analyzed numerically. The 3dB bandwidth tunable filter is obtained by adjusting the magneto-optical coupling intensity. The clock extraction of 40Gbps

RZ data signal by utilizing the comb filtering of MFBGs under bias magnetic fields is simulated and the jitter performance of the MFBGs is also analyzed.

Keywords: all-optical clock extraction  
magnetooptic fiber Bragg grating (MFBG) tunable  
comb filter
