摘要:

利用LB(Langmuir-Blodgett)技术, 采用循环压缩的方法在不同基底表面上制备FePt纳米粒子单层膜, 采用TEM和AFM等技术手段对其表面形貌进行表征。研究结果表明, 采用循环压缩的方法可以大大提高单层膜的均匀性和致密性, 并且在不同的基底表面其成膜性能具有较大的差异。

Abstract:

Recently, a lot of methods were devised to prepare an ordered arrangement of nanomaterials, such as self-organization, electrophoretic deposition, and Langmuir-Blodgett(LB), etc. The LB technique was proven a powerful and simple method to prepare the high-density nanoparticle monolayer and multilayer film with controllable layer numbers and thickness. In this article, we introduced an improved LB method to fabricate the FePt nanoparticle monolayer film. The LB monolayer of FePt nanoparticles was fabricated on different substrates using a cycling compression method. The monolayers have a smooth surface and a high-density structure on hydrophobic surface as shown by the TEM and AFM image. The results show that the uniformity and stability of the monolayer can largely improve by this method, and the surface morphology of monolayers was varied between the substrates.

Keywords: LB technique FePt nanoparticle Substrate
