**摘要** 质谱学在新的甾醇特别是海洋甾醇的结构鉴定中起到了至关重要的作用。对质谱的确切解释需要对甾醇的关键裂解规律有足够的了解。本文总结了如下三类甾醇乙酸酯中最重要碎片峰的裂解机理的解释: (1)  $\Delta 5, 22$ —甾醇乙酸酯; (2)  $\Delta 5, 24(25)$ —甾醇乙酸酯; (3)  $\Delta 5, 24(28)$ —甾醇乙酸酯。我们将此规律应用于南海海绵甾醇的结构鉴定中。

## Abstract The Regular Patterns of Mass Spectrometry of Sterols and Related Derivatives

( I ) . Mass Spectrometric Fragmentation Typicality of 5, 22-Dien-; 5, 24 (25) -Dien-and 5, 24 (28) -Dien —Seryl Acetates—Seryl Acetates\$\$\$\$Zeng Zhi; Zeng Longmei (Department of Chemistry, Zhongshan University, Guangzhou 510275, China)Xiang Tongshou (National Laboratory of Organic Geochemistry, Chinese Academy of Sciences, Guangzhou 510640, China)Received 1993-05-25Abstract: Mass spectrometry plays a crucial role in the structure elucidation on new sterols, notably those from marine organism. Secure interpretation of the mass spectra requires an adequate understanding of the mechanism of the key fragmentation processes of steroids and the present paper summarizes the elucidation of the fragmentation mechanism of the most important peaks of the following classes of seryl acetates: (1) 5, 22dien - ; (2) 5, 24 (25) -dien - ; and (3) 5, 24 (28) -dien-seryl acetates. Attention is drawn to the utility of such mass spectral decompositions in structure elucidation of the marine sterols isolated from the South China Sea sponges.Keywords: marine sponge, sterol, mass spectrum
