摘要：本文用<sup>3H</sup>标记的方法研究加替沙星在小鼠体内的吸收、分布和排泄。小鼠静脉注射<sup>3H</sup>-加替沙星三个剂量：4mg/Kg、8mg/Kg、16mg/Kg，用液体闪烁谱仪测定不同时间血药浓度，建立血药浓度-时间关系。结果显示：静脉注射<sup>3H</sup>-加替沙星在小鼠体内代谢符合二房室开放模型，分布相半衰期T<sub>1/2α</sub>分别为0.16h，0.15h和0.19h；消除相半衰期T<sub>1/2β</sub>分别为55.55h，45.75h，和52.11h；表观分布容积V分别为0.77L·Kg<sup>-1</sup>，0.62L·Kg<sup>-1</sup>和0.95L·Kg<sup>-1</sup>；曲线下面积AUC分别为74.08?g·h·L<sup>-1</sup>，89.28?g·h·L<sup>-1</sup>和211.88?g·h·L<sup>-1</sup>。<sup>3H</sup>-加替沙星在小鼠体内分布很广，没有发现特异性组织积累。

**Abstract:** Absorption, distribution and elimination of Gatifloxacin in mice are studied using <sup>3H</sup> labeling method. After iv injection of 4mg(9.25MBq)/Kg, 8mg(18.5MBq)/Kg and 16mg(37MBq)/Kg <sup>3H</sup>-Gatifloxacin <sup>3H</sup>-Gatifloxacin concentration in blood is determinated with liquid scintillation analyzer. The results show that concentration-time curve after iv injection are fitted to a 2-compartment open model, Distribution phase half life T<sub>1/2α</sub> is 0.16, 0.15, 0.19h, respectively, elimination phase half life T<sub>1/2β</sub> is 55.55, 45.75, 52.11h respectively, the appearance volume of distribution V is 0.77, 0.62, 0.95 L?Kg<sup>-1</sup> respectively, area under curve AUC is 74.08, 89.28, 211.88 ?g?h?L<sup>-1</sup> <sup>3H</sup>-Gatifloxacin is distributed extensively in various tissue and organ in mice but is not found accumulation in special tissue and organ.

**Key words:** Gatifloxacin, Absorption, Distribution, Radioactivity, Liquid scintillation analyzer
