Eugene Mash

Professor

Email: emash@email.arizona.edu

Building: CSML 618

Phone: 520-621-6321

Honors

- College of Science Innovation in Teaching Award, 1995
- IBM Paul J Flory Fellow, Almaden Research Center, 1990-1991
- College of Science Distinguished Career Teaching Award, 2009

Education and Appointments

- B.S. 1975, The University of California, Irvine
- B.A. 1975, The University of California, Irvine
- Ph.D. 1980, The University of Utah
- NIH Postdoctoral Fellow 1981-1983, Harvard University

Research Interests

- Organic
- Bioorganic
- Materials and Polymer Chemistry
- Synthesis/Synthetic Methods Development

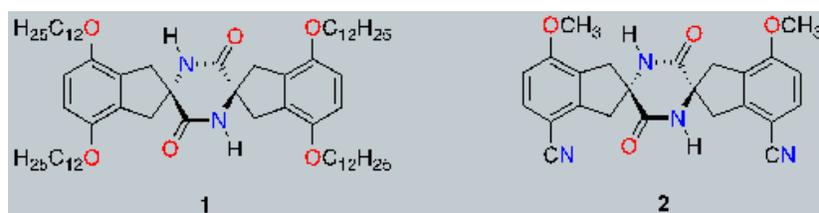

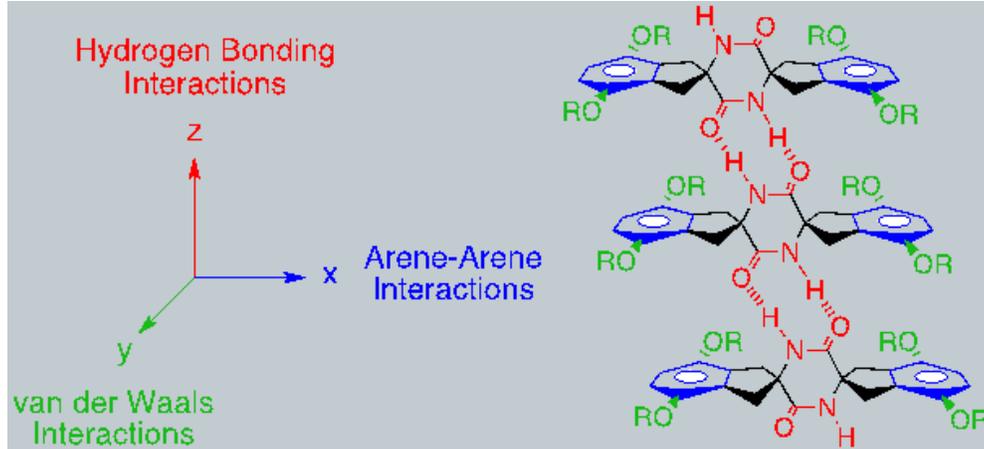

Research Summary

Organic Chemistry

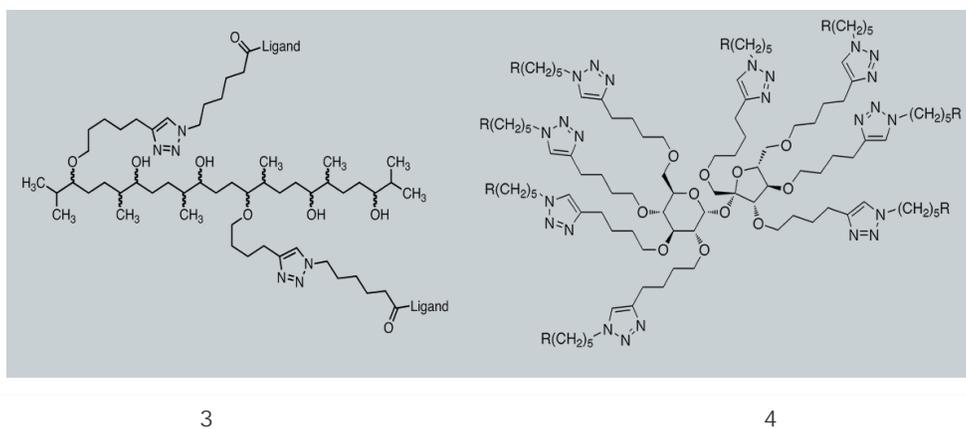

The ability to synthesize molecules is of fundamental importance and at the core of advances in every technological field. We seek to advance the synthetic art and to solve chemical problems in areas such as materials science and biology. Current focus areas include:

Engineering organic crystals. Non-covalent interactions are of universal importance in chemistry, materials science, and biology. Using a family of piperazinedione-containing molecules, we have demonstrated that the three-dimensional order of an organic crystal can be controlled by incorporation of three linearly independent molecular recognition elements (Figure 1). In this way we have produced bulk materials that exhibit liquid crystal properties (e.g., compound 1) or non-linear optical properties (e.g., compound 2). We are currently examining the effects of alterations of the arene substitution pattern on crystal packing and bulk properties.

Figure 1. Design of a piperazinedione for liquid crystal applications.

Development of Multivalent Constructs. We are developing scaffolds for the display of multiple ligands, imaging agents, and/or pro-drug moieties which may find applications in cancer imaging, diagnosis, and therapy. Scaffolds of current interest include terpene-derived scaffold 3 and sucrose-derived scaffold 4.

Selected Publications
