**摘要** 通过XRD, BET, In-situ XPS等表征技术对Cu/ZnO基甲醇裂解制氢催化剂进行了详细的研究。XRD结果表明, Cu-Zn合金的生成是Cu/ZnO基催化剂在反应初期快速失活的主要原因; XRD, BET和N<sub>2</sub>O滴定实验结果表明, Ni助剂可能是通过提高Cu<sup>0</sup>活性物种的分散度并维持Cu<sup>0</sup>活性物种在催化反应过程中的稳定性而使Cu/Zn/Ni催化剂的活性及稳定性大幅度提高。In-situ XPS结果表明, Ni助剂的加入可以诱导Cu/Zn/Ni催化剂表面在甲醇裂解反应过程中出现Cu<sup>+</sup>, 从而由Cu<sup>0</sup>/Cu<sup>+</sup>共同构成催化剂的活性中心, 并最终导致Cu/Zn/Ni催化剂的高活性。

**Abstract** XRD, BET and In-situ XPS techniques were used to study the performance of Cu/ZnO based catalysts for methanol decomposition. XRD studies indicated that the formation of Cu-Zn alloys was the major reason for the quickly deactivation of Cu/Zn catalyst for methanol decomposition at the initial stage of the reaction. XRD, BET and N<sub>2</sub>O titration results confirmed that nickel additive could increase the dispersity of active Cu<sup>0</sup> species during the catalytic process and maintain the stability during the reaction. In-situ XPS studies confirmed that the active center in Cu/Zn/Ni catalyst was Cu<sup>0</sup> and/or Cu<sup>+</sup> species, in which Cu<sup>+</sup> was formed during the reaction.
