Holographic Superconductors in Hořava-Lifshitz Gravity

Jiliang Jing, Liancheng Wang, Songbai Chen

(Submitted on 10 Jan 2010 (v1), last revised 25 Jan 2010 (this version, v2))

We study (2+1)-dimensional holographic superconductors in the Ho\v {r}ava-Lifshitz black hole without the condition of the detailed balance which has rich physics, i.e., changing the parameter of the detailed balance $\$ balance $\$ physics, i.e., changing the parameter of the detailed balance $\$ balance $\$ physics, i.e., changing the parameter of the detailed balance $\$ physics, i.e., changing the parameter of the detailed balance $\$ physics, i.e., changing the parameter of the detailed balance $\$ physics, i.e., changing the parameter of the detailed balance $\$ physics, i.e., changing the parameter of the detailed balance $\$ physics, i.e., changing the parameter of the detailed balance $\$ physics, i.e., changing the parameter of the detailed balance $\$ physics, i.e., changing the parameter of the detailed balance $\$ physics, i.e., changing the parameter of the detailed balance $\$ physics, i.e., changing the parameter of the detailed balance becomes larger, but harder when the mass of the scalar field is larger. We also find that the ratio of the gap frequency in conductivity to the critical temperature, $\$ physics, for the scalar field is larger and the parameter of the balance constant. The ratio reduces to Cai's result $\$ physics, i.e., physical ph
