

Solar-like Oscillations: An Observational Perspective

[Timothy R. Bedding](#)

(Submitted on 8 Jul 2011)

Solar-like oscillations are excited stochastically by convection. They occur in stars with an outer convection zone, which includes the Sun and other stars on the lower main sequence, as well as cool subgiants and red giants. This chapter reviews the basic properties of solar-like oscillations and summarises some of the main observational results. Mixed modes in subgiants and red giants are discussed in some detail, including an introduction to the so-called p-g diagram for avoided crossings.

Comments: This will appear as a chapter in "Asteroseismology", Canary Islands Winter School of Astrophysics, Volume XXII, edited by Pere L. Pall\`e, published by Cambridge University Press
