摘要：

本文以伊犁盆地扎吉斯坦层间氧化带砂岩型铀矿床为例,阐述了其中分散元素Re与Se的超常富集规律。研究表明分散元素Re与Se在空间上与砂岩U矿体密切共生,但其超常富集又具有独立性;在矿源等条件具备的情况下,层间氧化作用可以促使分散元素Re与Se超常富集并独立成矿,是一种潜在的分散元素成矿新机制。

Abstract:

The study of Zhajistan interlayer oxidation zone sandstone-type uranium ore deposit, Ili Basin, Xinjiang Uygur Autonomous Region, shows super-enriching of disperse-elements (Re, Se), coexisting within uranium ore-bodies. It is concluded that, although disperse-elements is characterized by associated with uranium ore-bodies in spatial, super-richening of disperse-elements have relative independence in interlayer oxidation. When conditions, such as original metallogenetic resources are suitable, interlayer oxidation can make super-richening of disperse-elements and form independent mineralization. Interlayer oxidation is a new type of potential metallogenetic mechanism of disperse-elements.
