研究了河北开滦矿区不同变质程度的煤对不同配比CH₄/CO₂二元气体等温解吸特性，并用扩展CH₄/CO₂二元气体各组分在吸附相中的浓度，分析了其变化特征。结果表明：在开滦矿区煤对CH₄4%～12%程序中，中等变质程度煤($R_{o}=1.21\%$)对混合气体的吸附能力大于低变质程度煤($R_{o}=0.58\%$)，且混合吸附量越多。吸附相中CH₄的相对浓度是逐渐降低的，CO₂的相对浓度是逐渐升高的。开滦矿区中等变质程度煤，用CO₂气体置换煤层中CH₄，可以获得较高的单位压降CH₄解吸率，注入CO₂的量越多越好。更适于往复层式CO₂置换煤层气高产技术的实施。

Abstract:

This paper describes the isothermal desorption characteristics of mixed CH₄/CO₂ gas Coals with different ranks from the Kailuan Coalfield, Hebei Province. The abundance and variation phases were analyzed using the extended Langmuir equation. The results of isothermal desorption experiment show that medium rank coal ($R_0 = 1.21\%$) has a stronger adsorption ability of the mixing gas than the low rank coal. The quantity of the adsorbed mixed gas by the coal increases with the increasing of the CO₂ quality. The relative abundance of CH₄ in adsorbed phase decreases and that of CO₂ increases gradually compared to the low rank coal, the medium rank has a higher unit desorption rate for CH₄. Therefore, with CO₂ will be more efficient when more quantity and higher relative abundance of CO₂. The rank coal is more subjected to be used for CO₂ Sequestration and Enhanced Coal bed Methane technology.

Keywords: Kailuan Coal field desorption isotherm experiment binary component gas adsorption phase
