Abstract: A new microsporidian parasite of *Phyllotreta undulata* was recorded in Turkey. Fresh spores are oval, $3.85 \pm 0.69 \mu\text{m}$ (2.0-4.75) in length and $2.04 \pm 0.23 \mu\text{m}$ (1.90-2.40) in width ($n = 50$). The spores are uninucleated. As there were insufficient data available on the complete life cycle of the parasite, it could not be identified at species level.

Key Words: microsporidian parasite, *Phyllotreta undulata*, Chrysomelidae
