第6章 基因表达调控

(Controlling of the Gene Expression)

(Source:Pique,Michael and Peter E.Wright,Dept.(cover photo,science 245 (11 Aug 1989).))

6.1. transcriptional level control

6.2. post-transcriptional level control

6.3.Gene expression control in translation level

6.4. 染色质重建对基因表达的控制

6.5.Programmed Cell Death (PCD) and development

基因表达调控的简介

阐明的科学问题

真核与原核生物如何调控数以千、万计的基因以最为经济、有效的时空模式进行转录，从而实现对环境的适应、细胞的分化, 组织的特化 和个体的发育。

原核生物与真核生物基因表达调控机制具有惊人的相似性

共同的起源与共同的分子基础

- 调控机理上
  - 核酸分子间的互作
  - 核酸与蛋白质分子间的互作
  - 蛋白质分子间的互作
- 调控层次上
  - **transcriptional level**
  - **post—transcriptional level**
  - **translational level**
  - **post—translational level**

基因表达的调控涉及

RNA转录的开/关

数量

选择性加工

蛋白质翻译速率

数量

加工、降解和分泌…

转录水平上的调控是最为经济，灵活，又是最为重要，复杂的调控

- 在复杂的基因组内，确定需要基因转录的起始位点
- 精细调节基因表达的水平，以保证生物体对环境的适应
- cis factor & trans factor 间严格而又灵活的互作
- 保证RNA polymerase 的进行式转录（不中断，准确终止）

遗传信息的概念

C > c

全基因组

10%；结构基因的编码序列

triplet codon（I类遗传信息）

90%；重复，调节序列, Non coding RNA…

基因选择性表达指令

重要的遗传信息（II类遗传信息）

遗传信息表达的方式

- 组成型表达（constitutive expression）

Housekeeping gene

- 诱导型表达

（inducible expression by signaling molecular）

Luxury gene

- 顺、反因子间和反式因之间的互作方式

Epistasis effect

6.1. transcriptional level control

Prok.

operon

stringent response

attenuator

transposon…

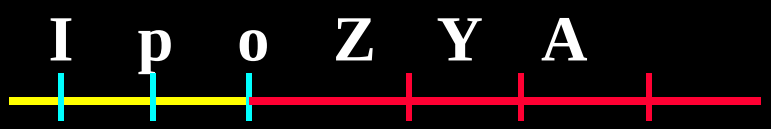
6.1.1. Operon control

(1961 Jacob. & Monod.)

a) operon concept

- 控制某一代谢途径的相关基因,
  紧密连锁地排列在一起, 受同一操纵子控制

Lac operon



- 各结构基因按一定比例协调翻译 (Z : Y : A = 5 : 2 : 1)
- 具有极性突变效应
- P & O基因(cis)紧密连锁 或 彼此重叠
  I 基因(trans) 位点不固定

b) operon control type

Negative & Positive

- I gene → repressor → Negative
- I gene → expressor (apoinducer) 无辅基诱导物 → Positive

i^- or 不加入I基因产物 → operon on

I^+ or 加入I基因产物 → operon off

Neg.

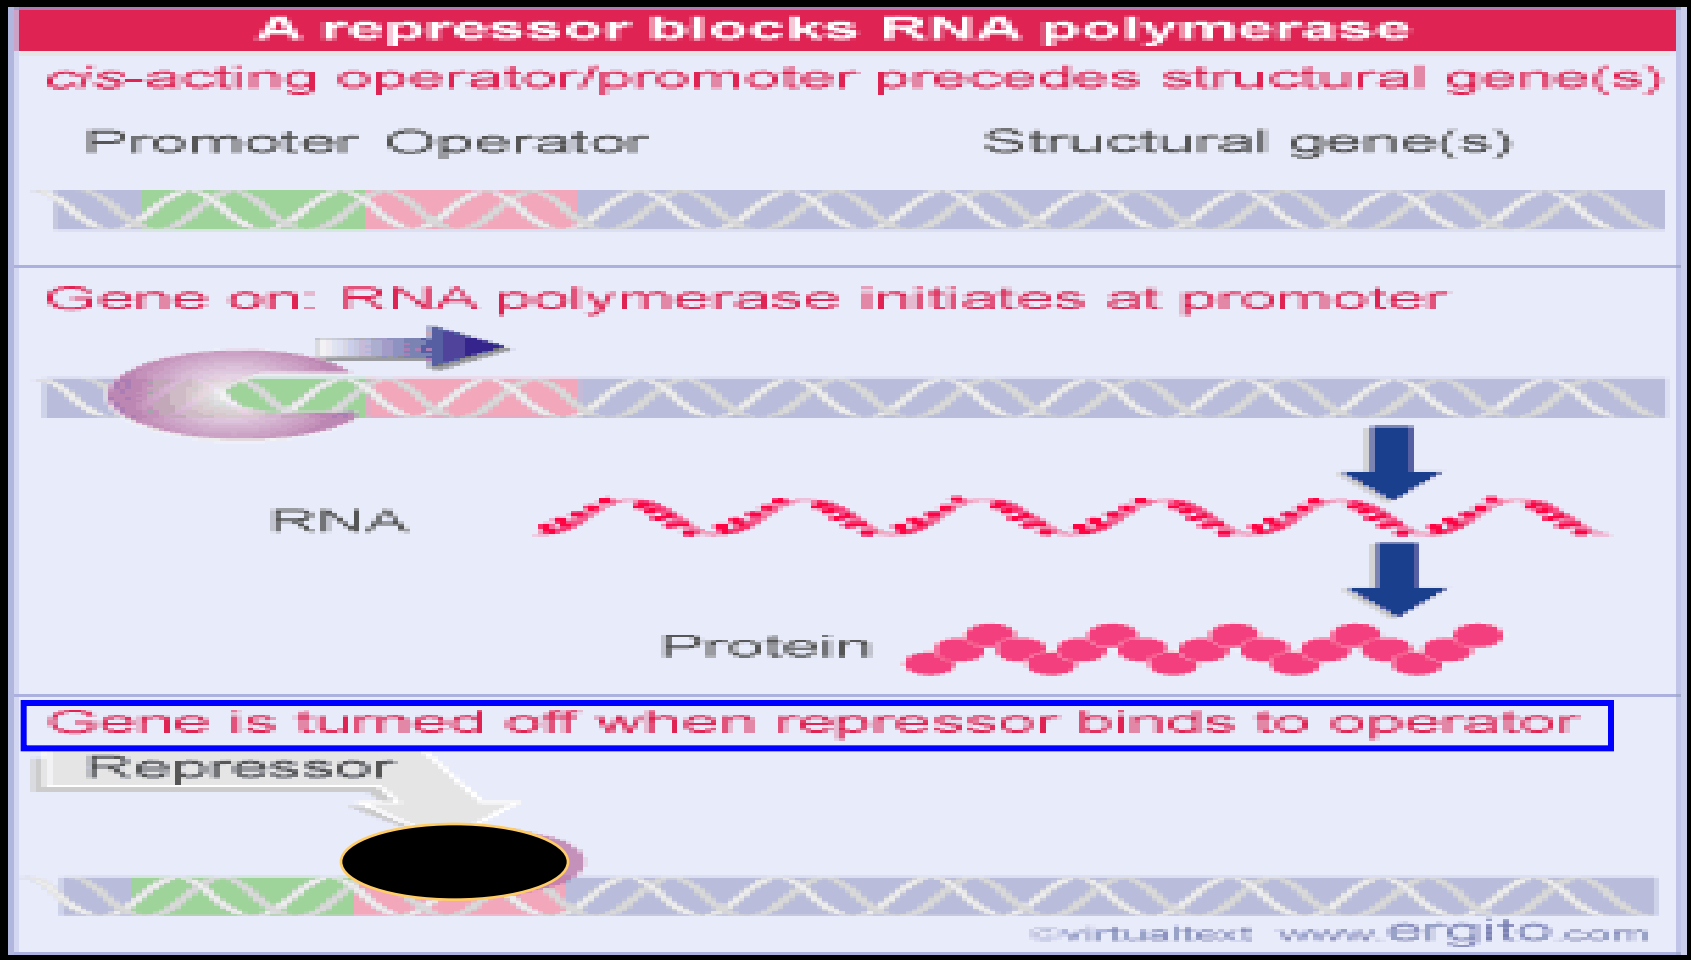
i^- or 不加入I基因产物 → operon off

I^+ or 加入I基因产物 → operon on

Pos.

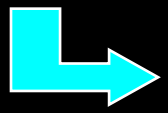
- **Repressor binding on O site**

阻止转录启动



(来源：分子生物学（2007），郑用琏，第239页)

- Expressor binding front p site



激活转录启动

- Operon off  意味转录效率极低

- Negative control 是广泛保险的机制

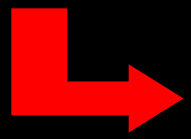
（自然选择使 Prok. 获得选择优势）

Positive control 是灵活，严格，经济的调控机制

c) Model

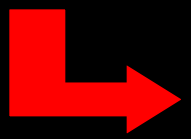
- **Signal molecular be needed for both types**

Add signal mol. → Operon on (inducible operon)



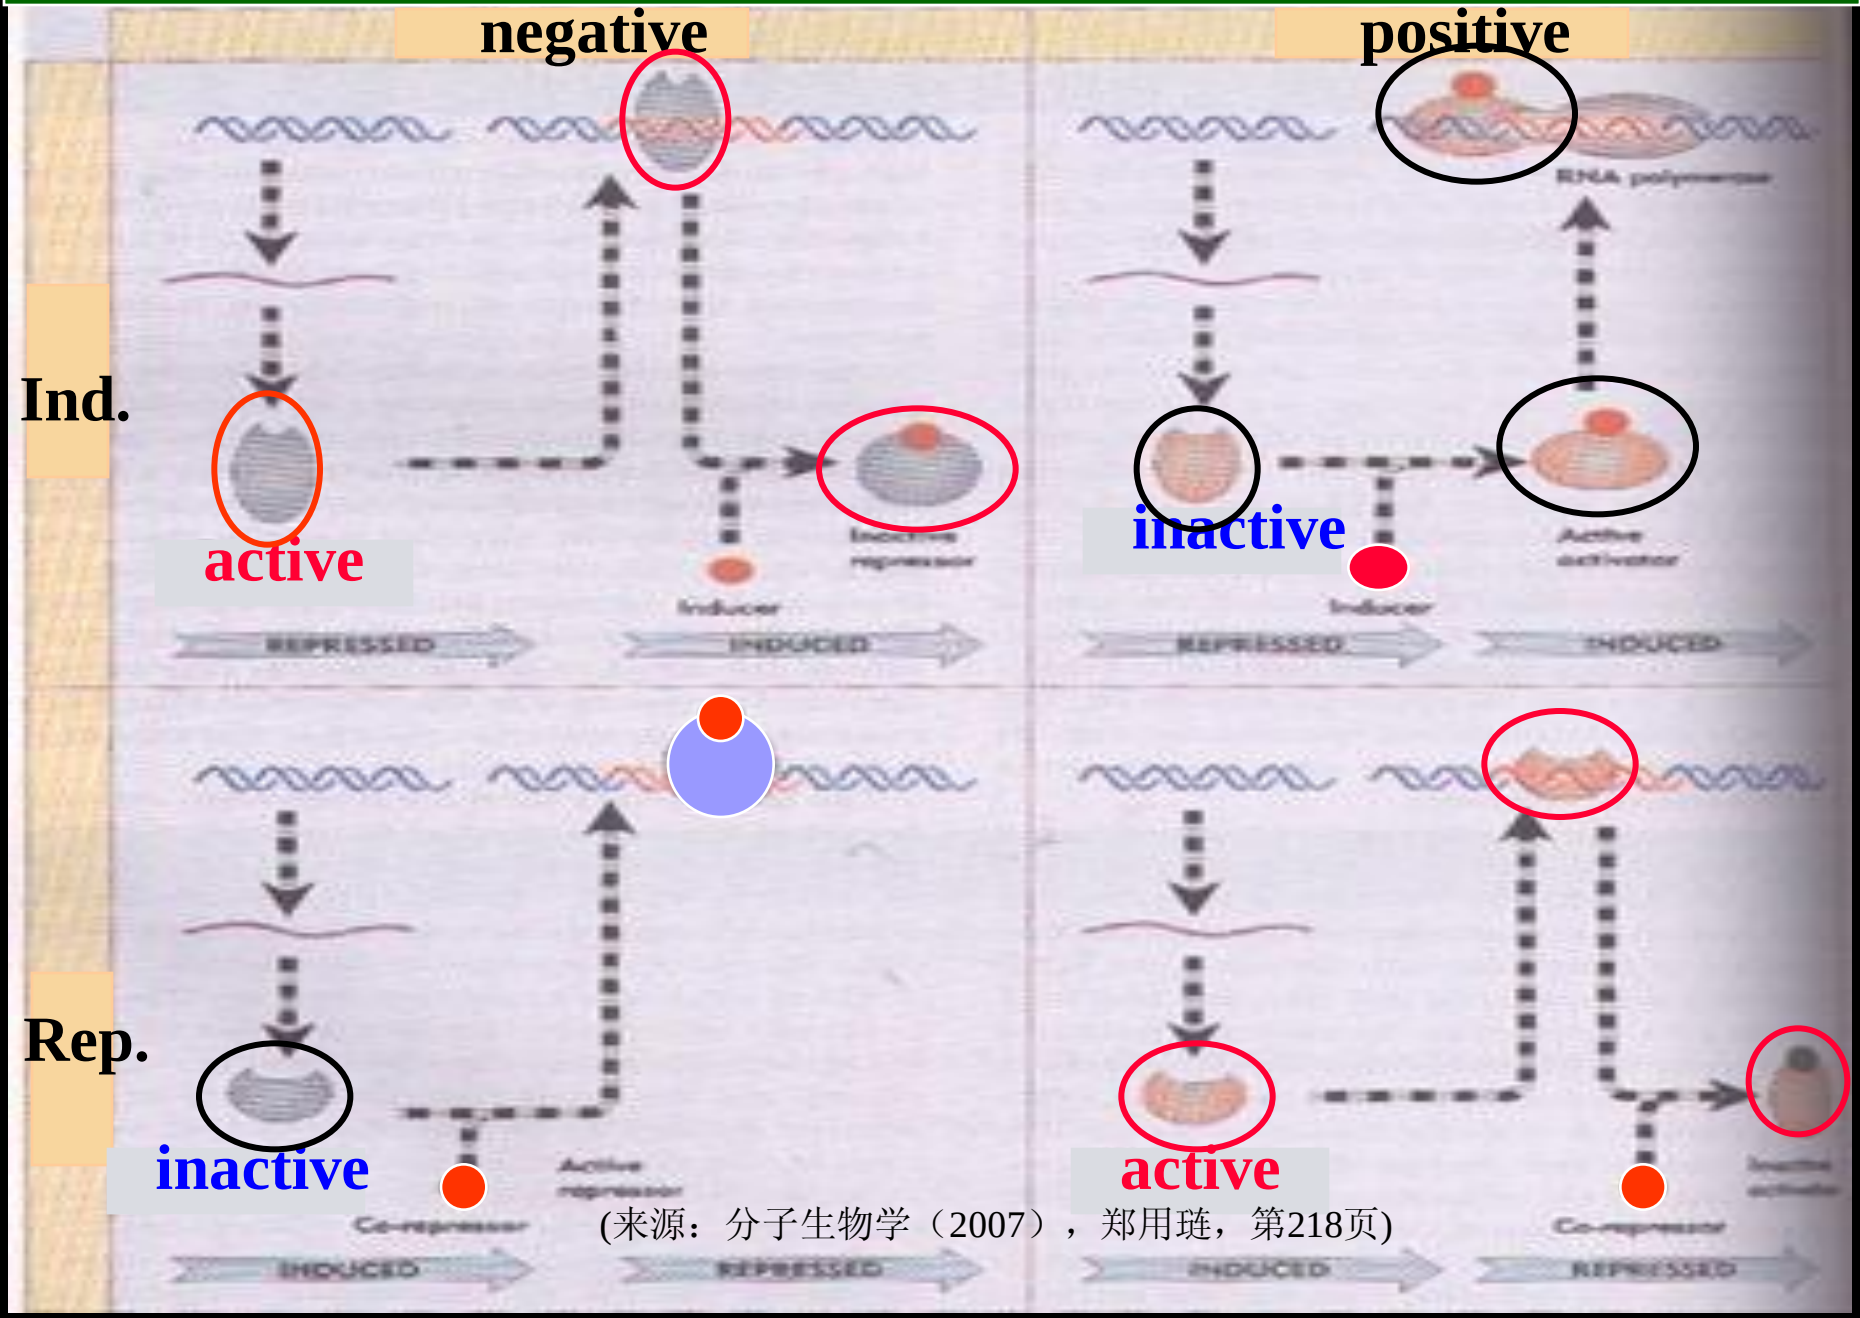
Inducer

Add signal mol. → Operon off (repressible operon)



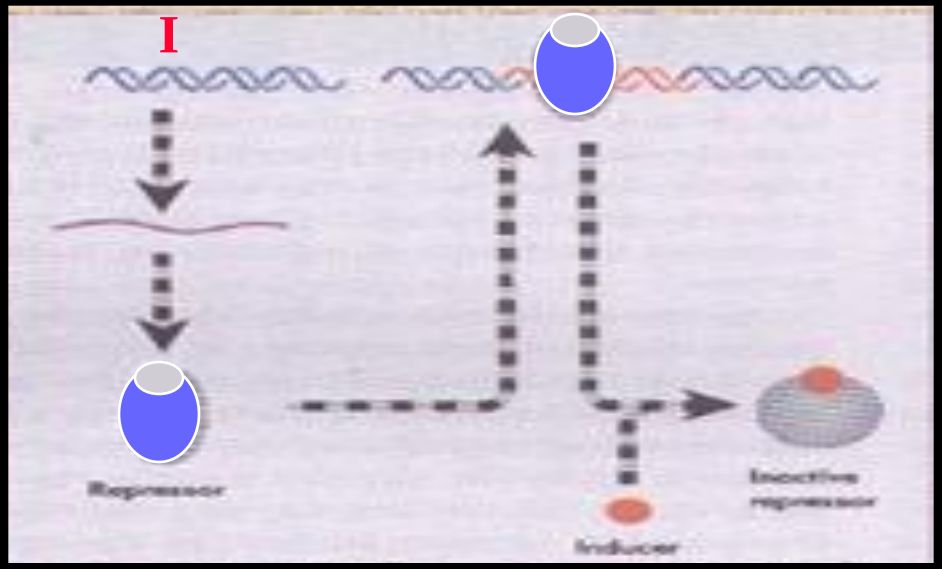
Co-repressor

Operon control model



(来源：分子生物学（2007），郑用琏，第218页)

• **Negative—inducible operon** 例 (分解酶类 lactose operon)



(来源：不详)

I gene → active repressor

38 kd / monomer

↓

tetramer 152 kd

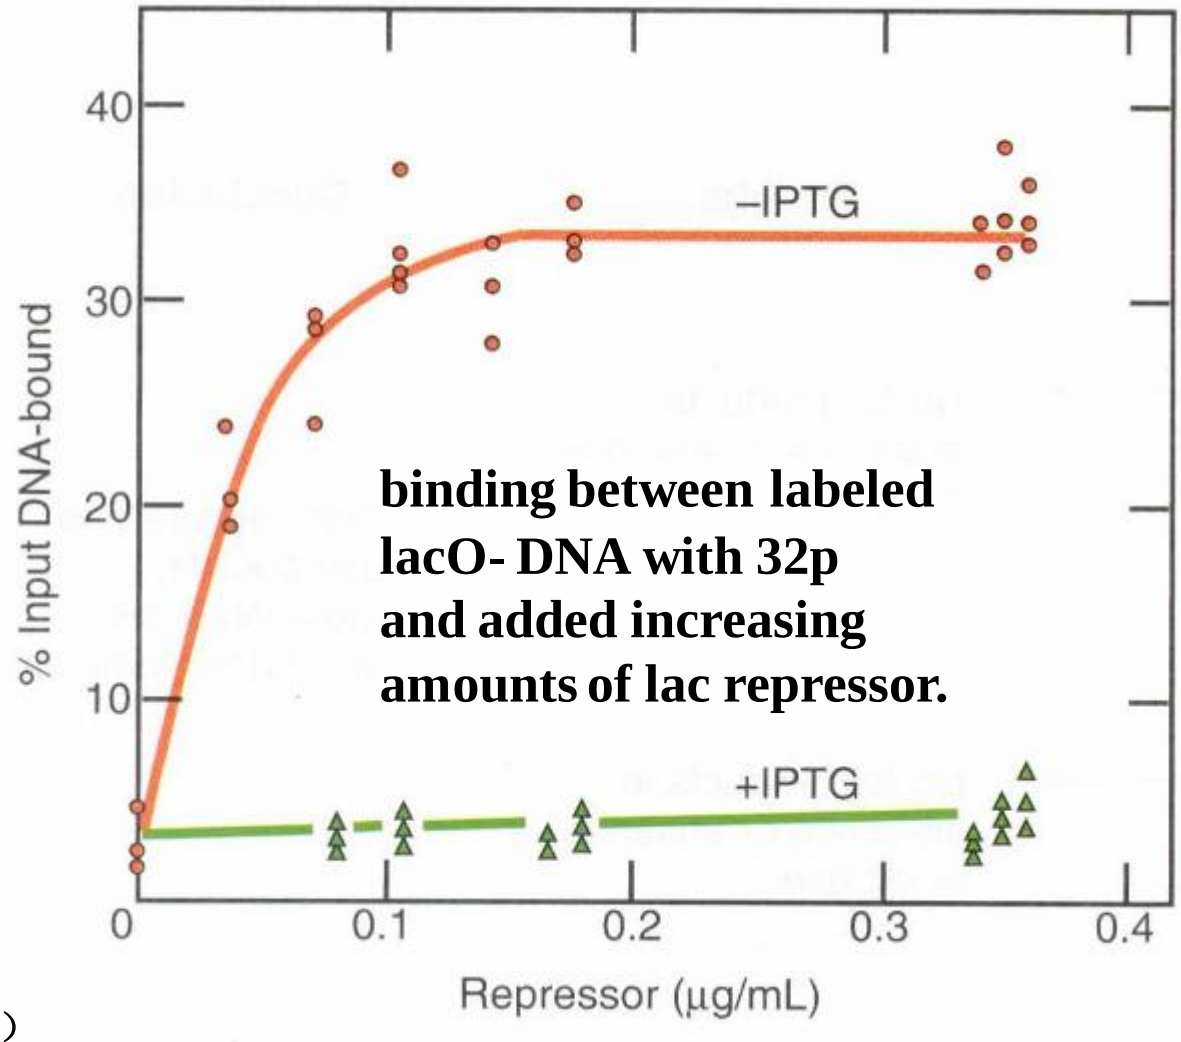
↓

binding on Operator

I^+ ⟶ mut. → i^C (constitutive mut.)

→ i^S (super--reperessible)

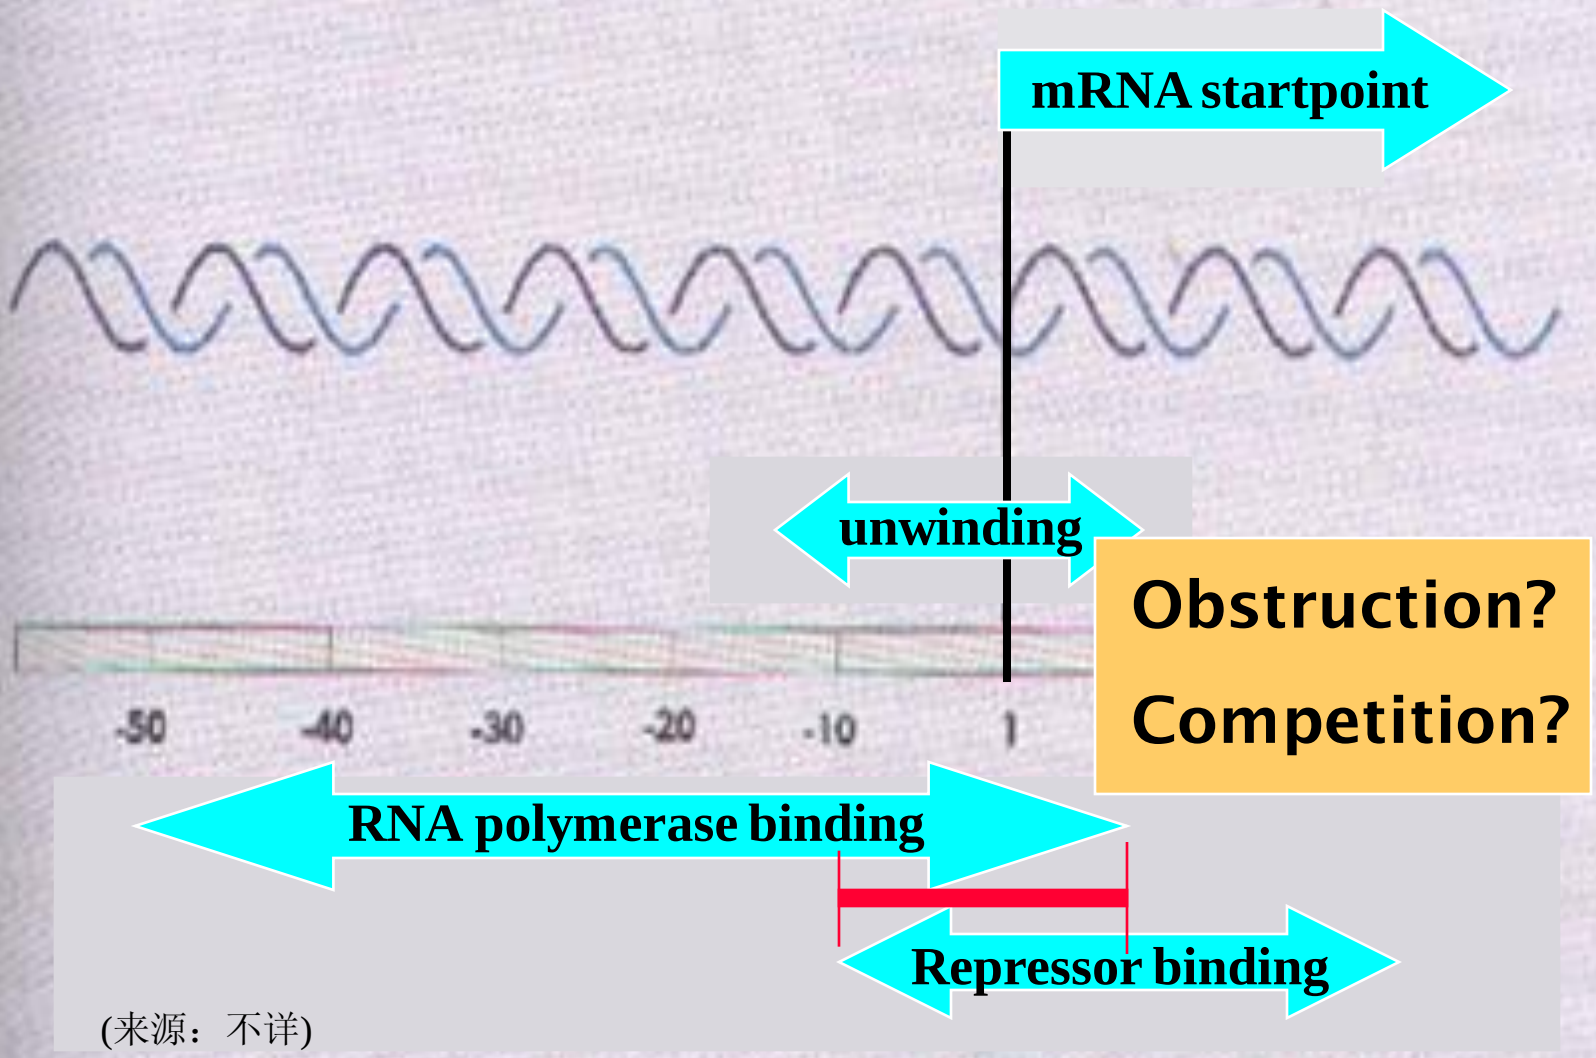
Lac or IPTG lactose analog is inducer of Lac operon



IPTG;异丙基－β －D－硫代半乳糖苷，自己不被分解的强诱导物（安慰诱导物）

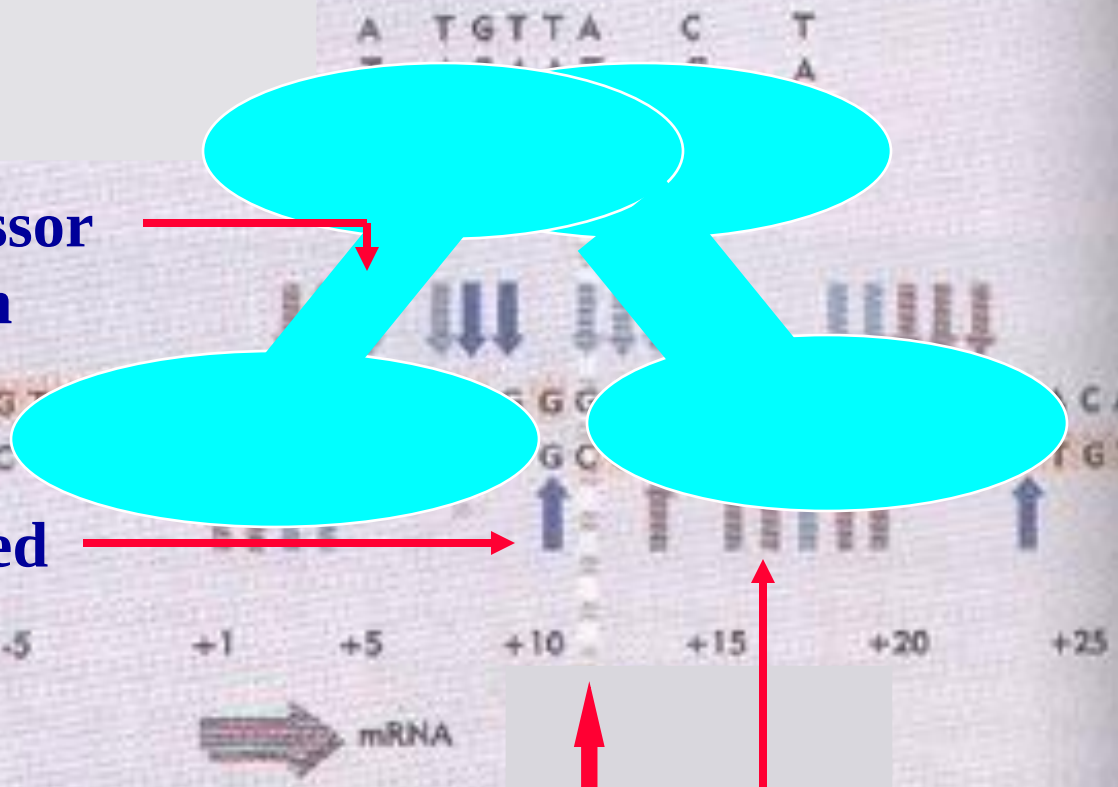
(Source:Cohn. Journal of Molecular Biology, Vol. 34: 366. 1968)

O gene (operator) cis-action factor



(来源：不详)

O gene (operator) cis-action factor



Protected by repressor against methylation

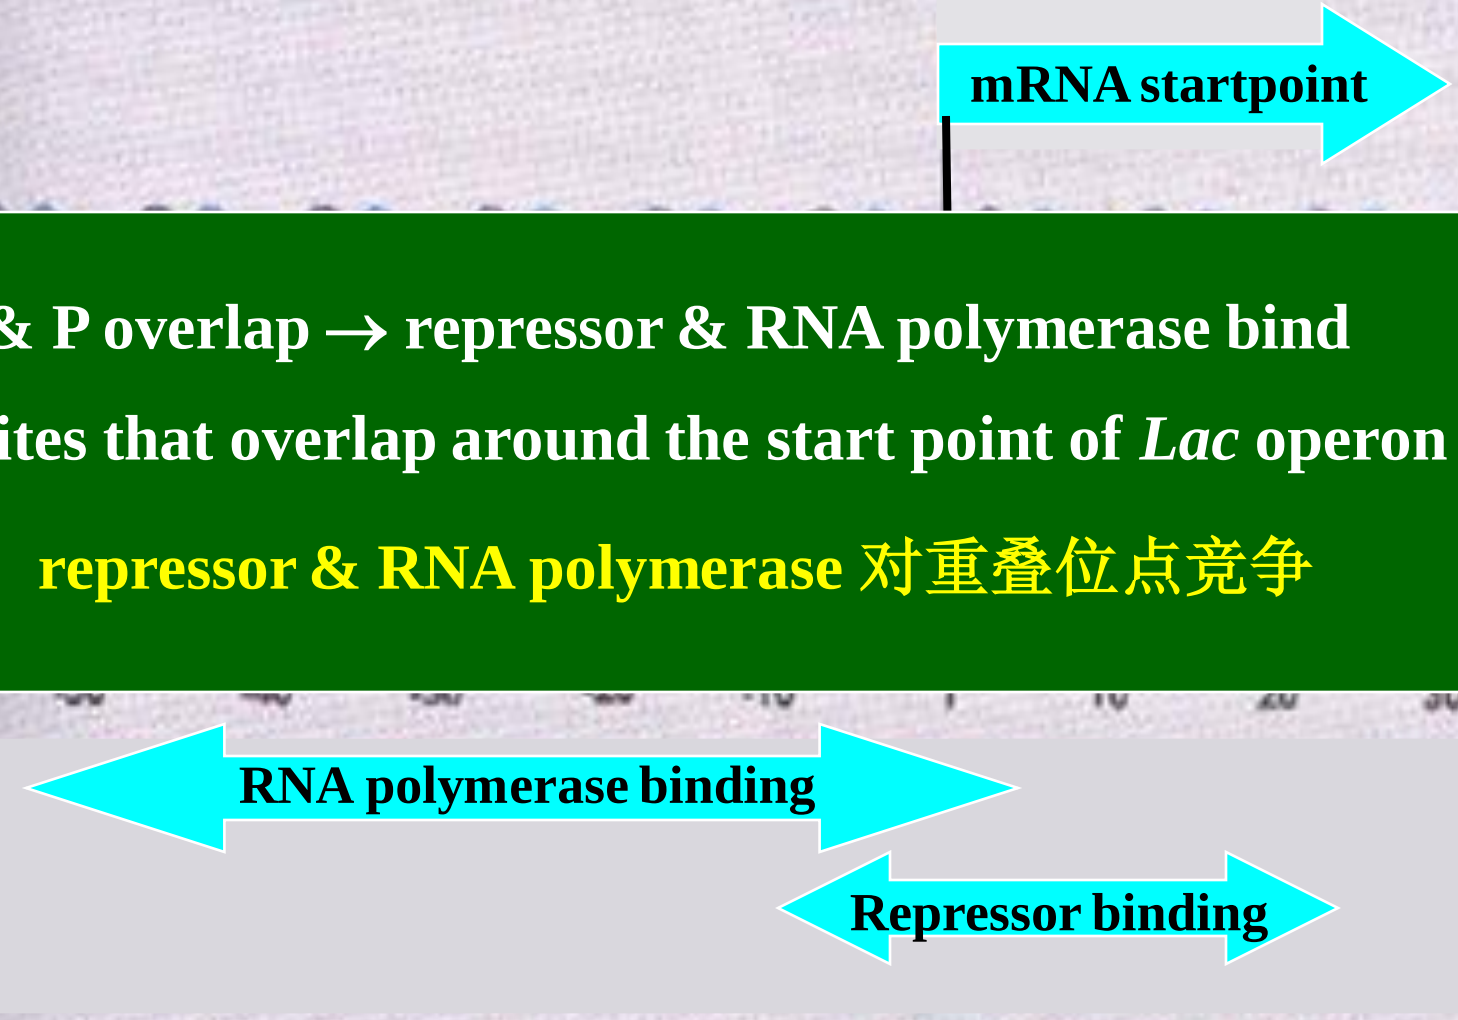
Methylation enhanced by repressor

Symmetrical seq. of 21 bp & G/C as axis

T can be crosslinked to repressor(binding site)

(来源：不详)

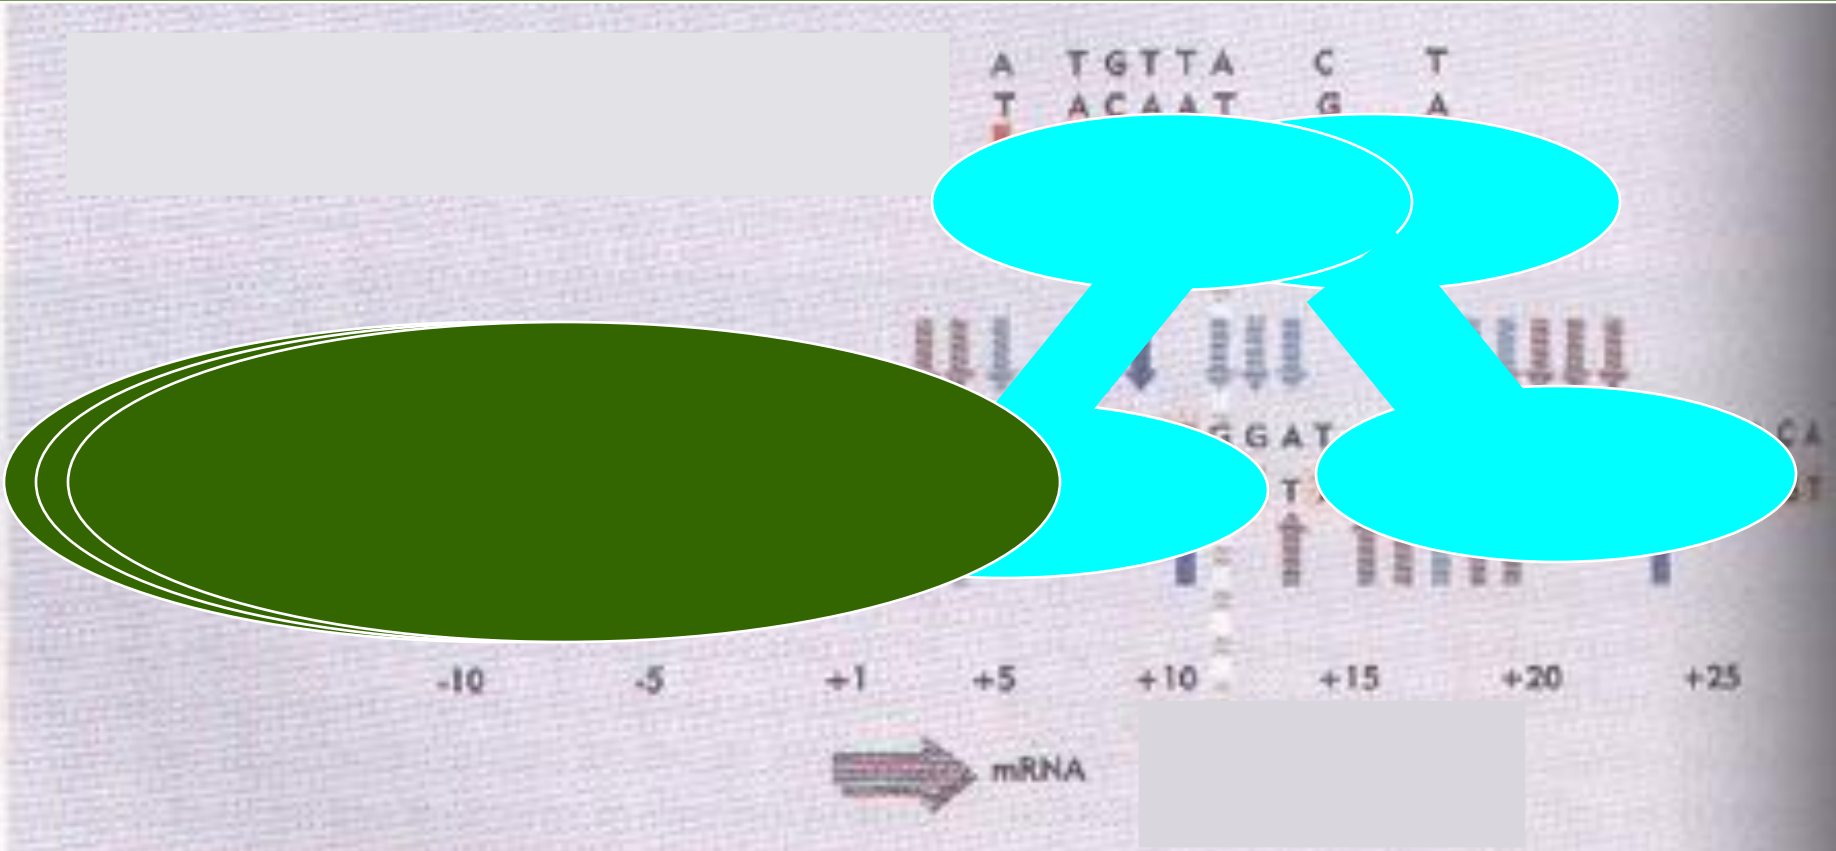
O gene (operator) cis-action factor



O & P overlap → repressor & RNA polymerase bind at sites that overlap around the start point of *Lac* operon

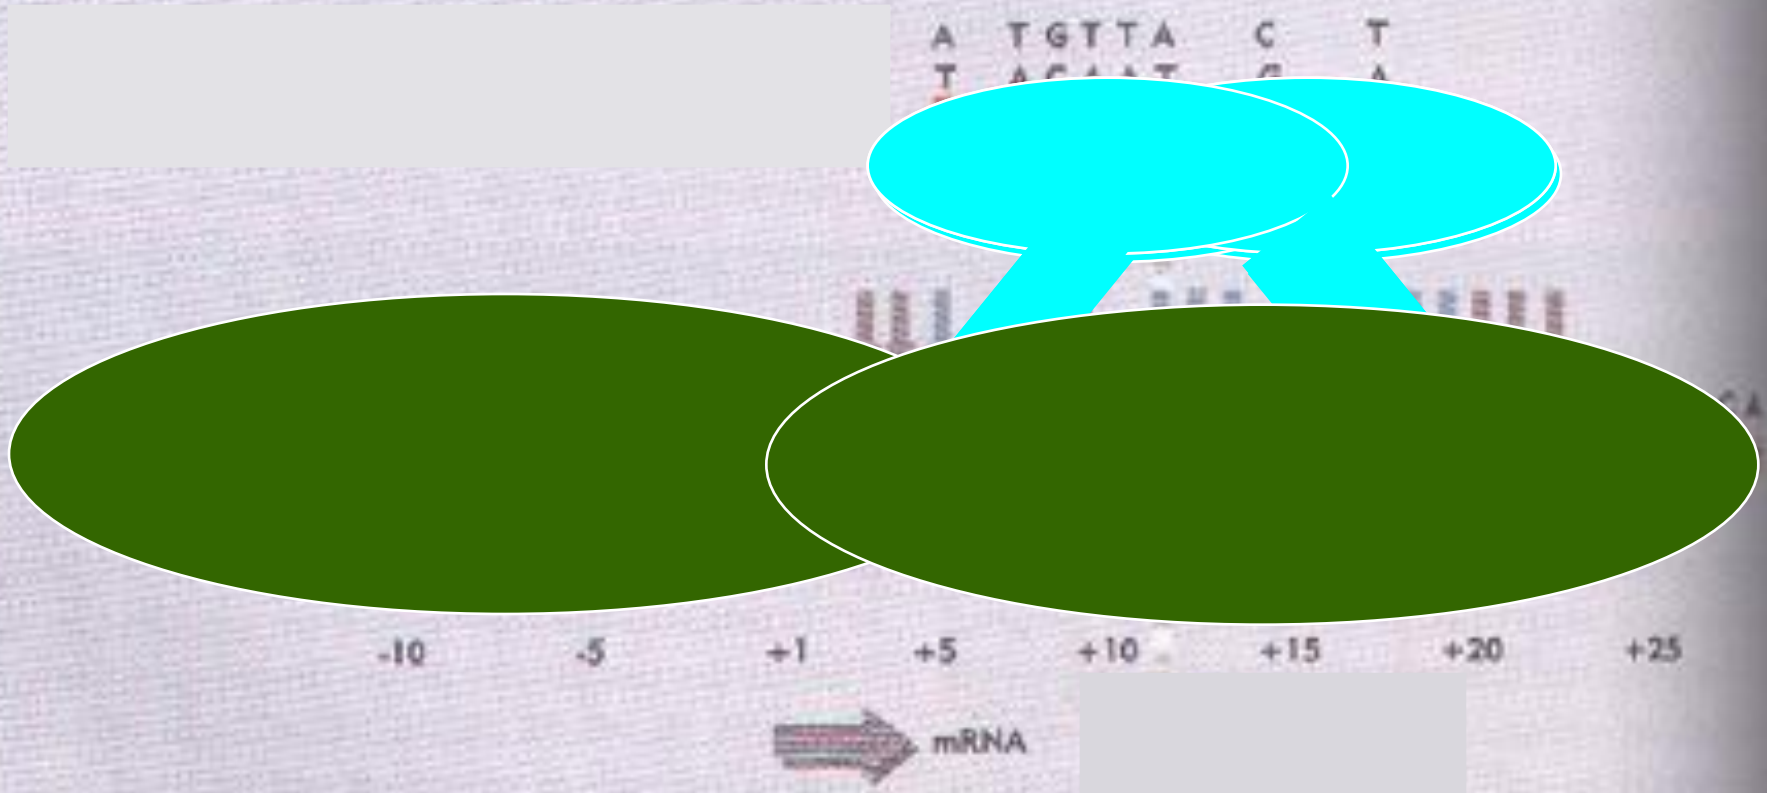
repressor & RNA polymerase 对重叠位点竞争

O gene (operator) cis-action factor



Obstruction

O gene (operator) cis-action factor



O^+ — mut. → O^C occur frequently at left site of axis (?)

---调控机理

repressor tetramer与operator发生特异结合

→ operon off

Inducer (lactose) 与repressor 特异结合

↓

tetramer 变构 → 特异结合力下降1000X

→ operon on

作用于 O 位点上的repressor → 变构 → 脱离O位

作用于游离的repressor

→ 变构 → 失去结合于O位的能力

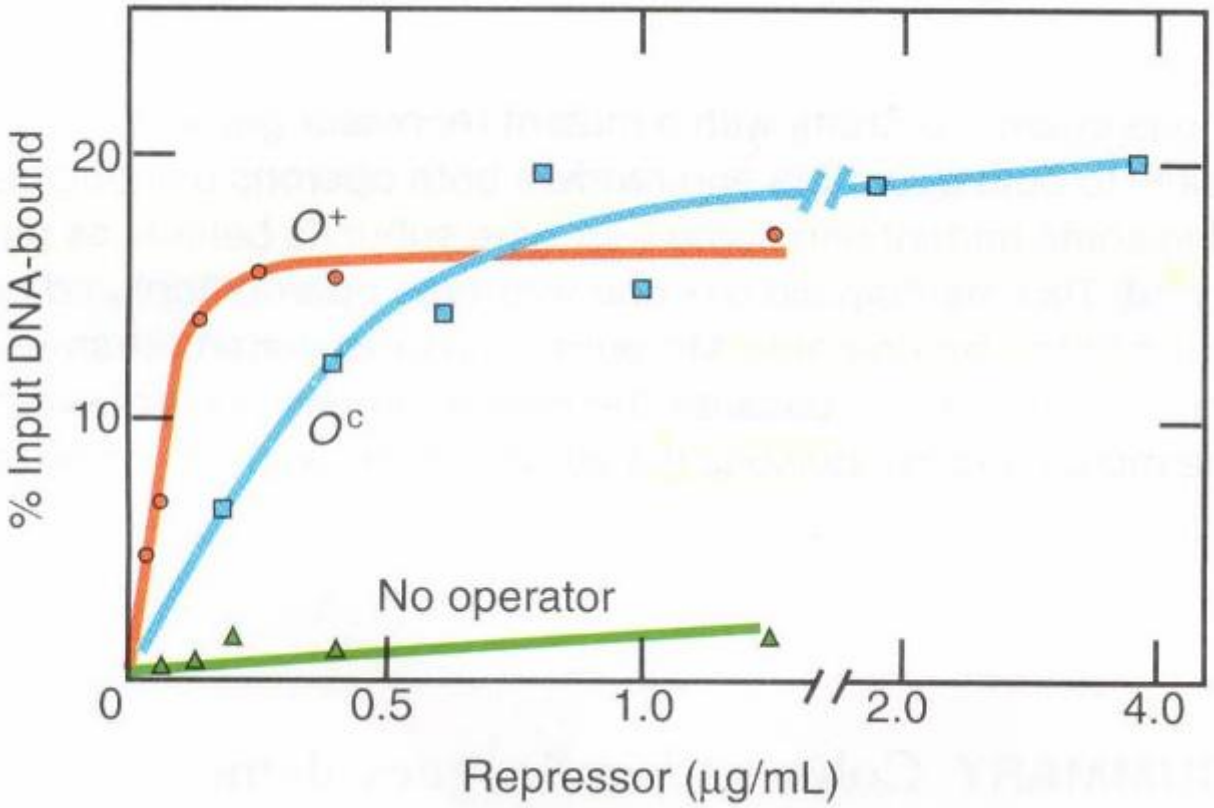
w.t. (I^+ O^+ P^+) 诱导型

add inducer → operon on

no inducer → operon off

O^C mut. (I^+ O^C P^+) constitutive mut. （组成型）

O^C失去与repressor特异结合的能力



wild-type operator (O+)

operator-constitutive mutation (O^c)

control 入Φ80 DNA,

(Source:Molecular Biology(2002),Robert F.Weaver,Page179）

The O^c lac operator binds repressor with lower affinity than does the wild-type operator, O^c required a higher concentration of repressor to achieve full binding.

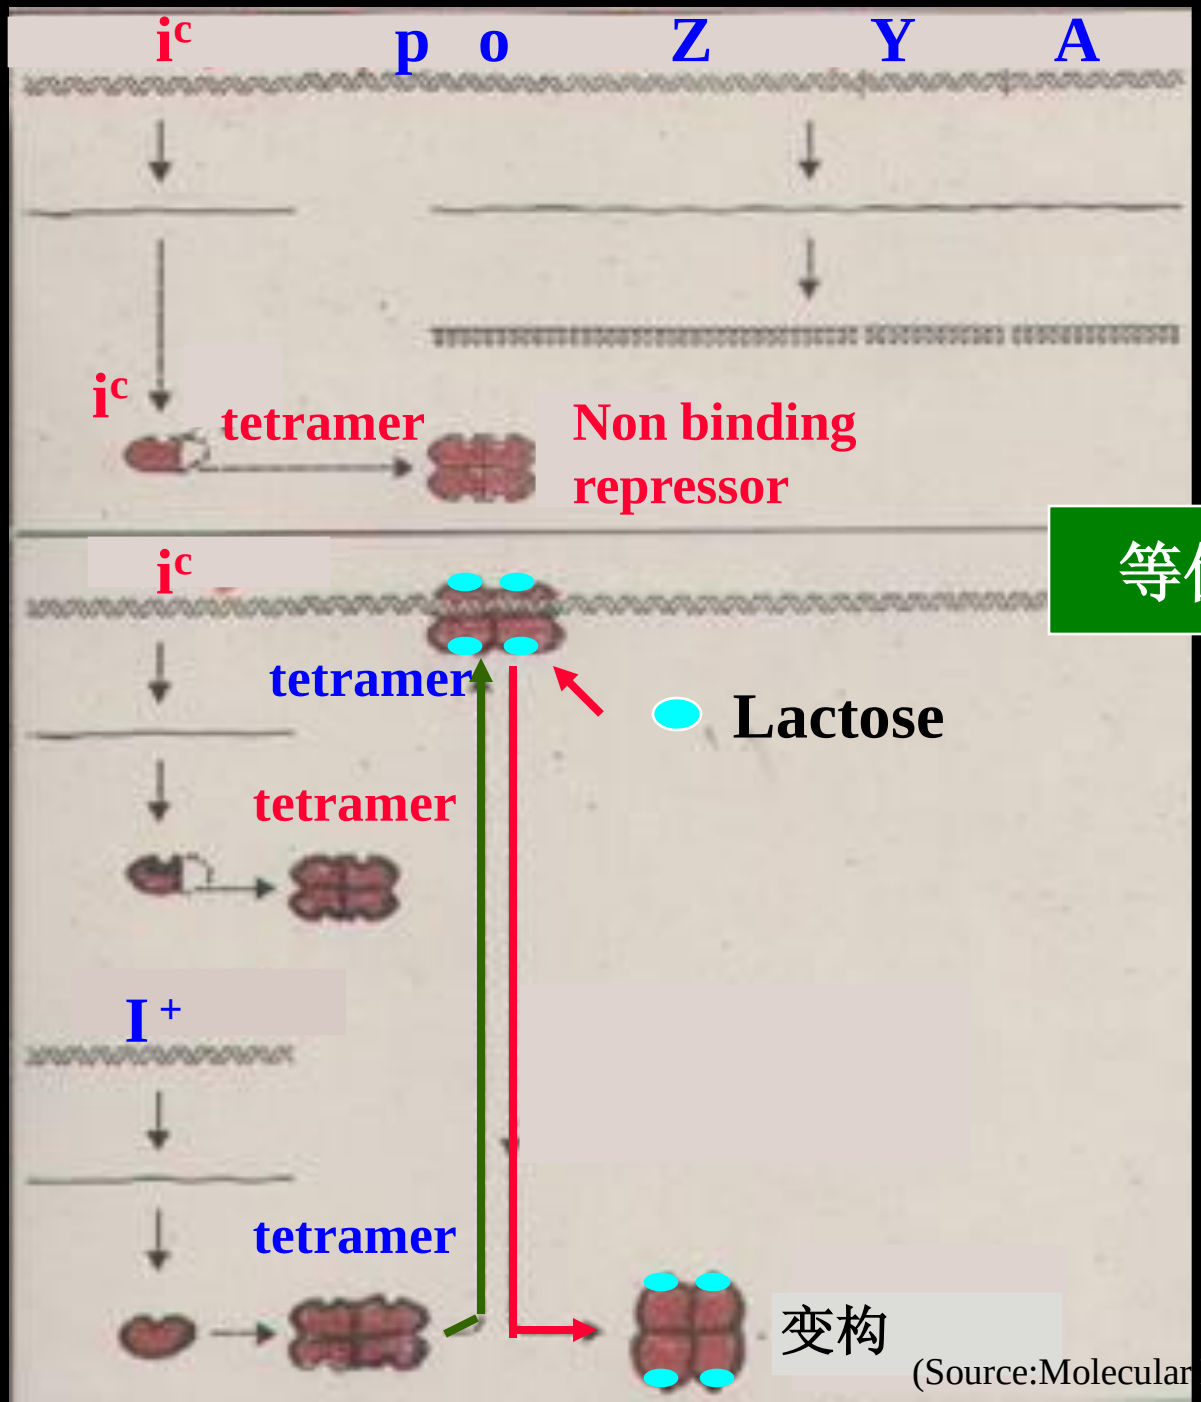
i^C mut. (i^C O^+P^+) constitutive mut. (组成型)

i^C gene产物repressor丧失与O位点结合的能力

i^S mut. (i^S O^+P^+) super-repression mut. (超阻型)

i^S gene 产物repessor 不能与inducer结合

等位基因间的显隐关系



i^C gene产物repressor

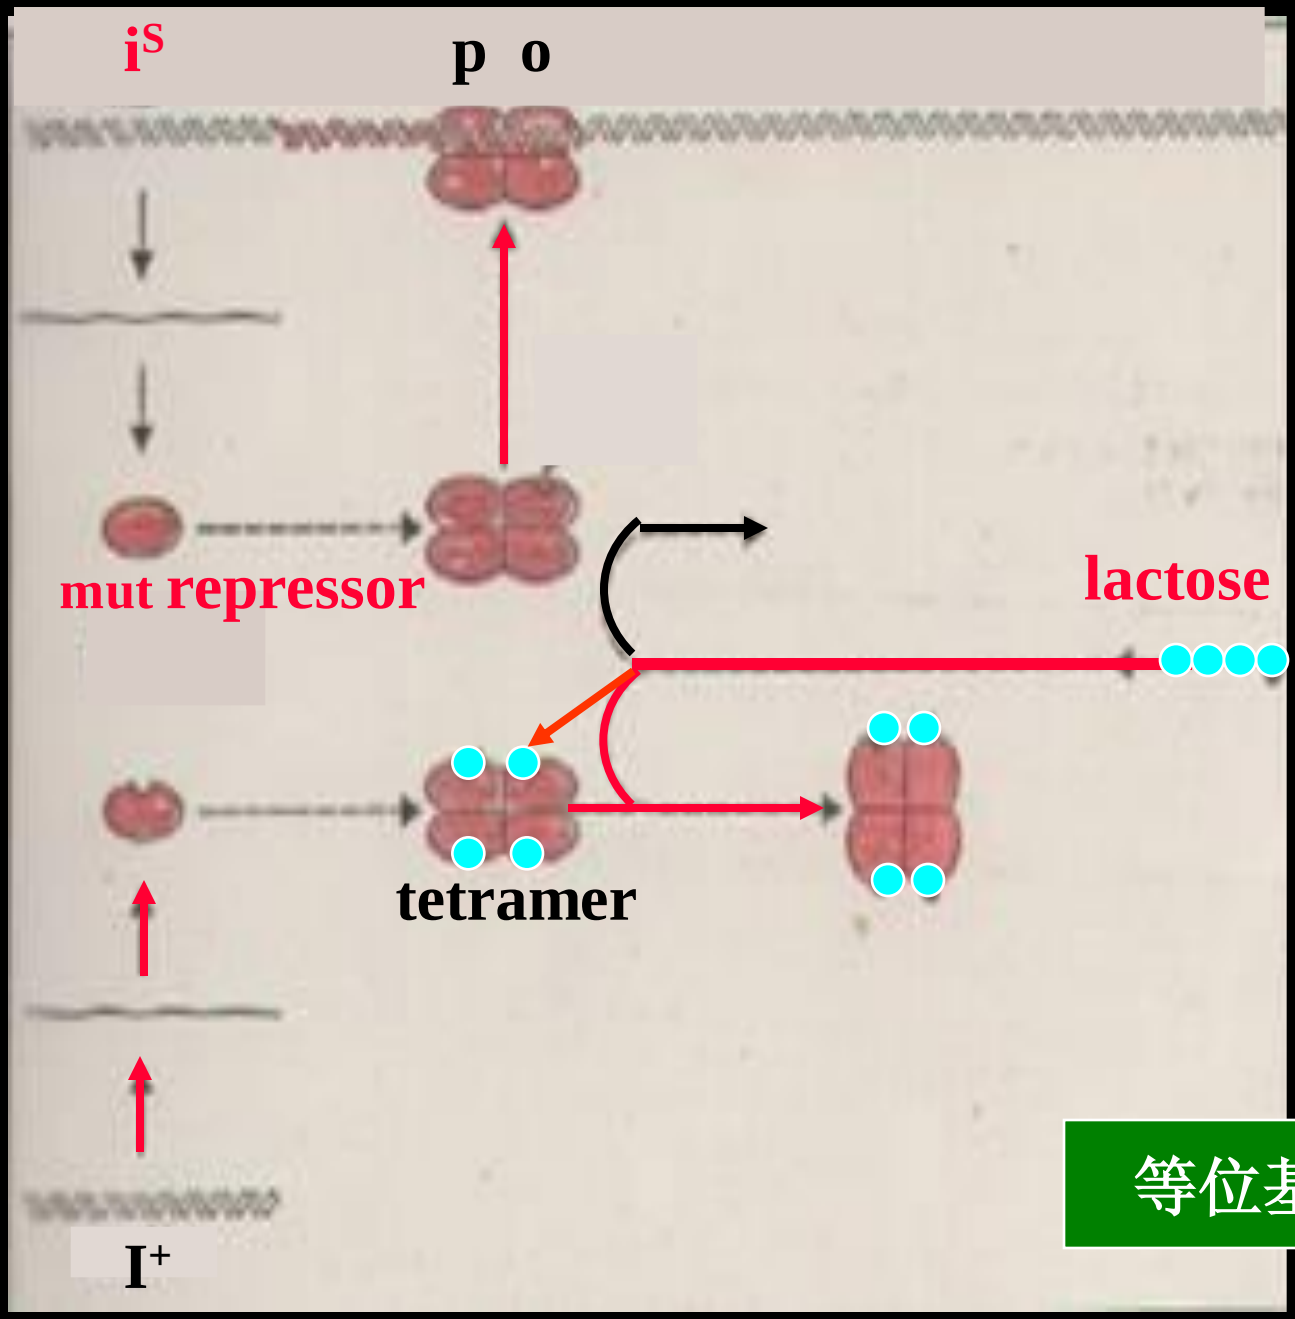
丧失与O位点结合的能力

等位基因间的显隐关系

I^+/I^C

$I^+ > i^C$

(Source:Molecular Biology(2002),Robert F.Weaver,Page177）



i^S gene 产物repessor

不能与 inducer 结合

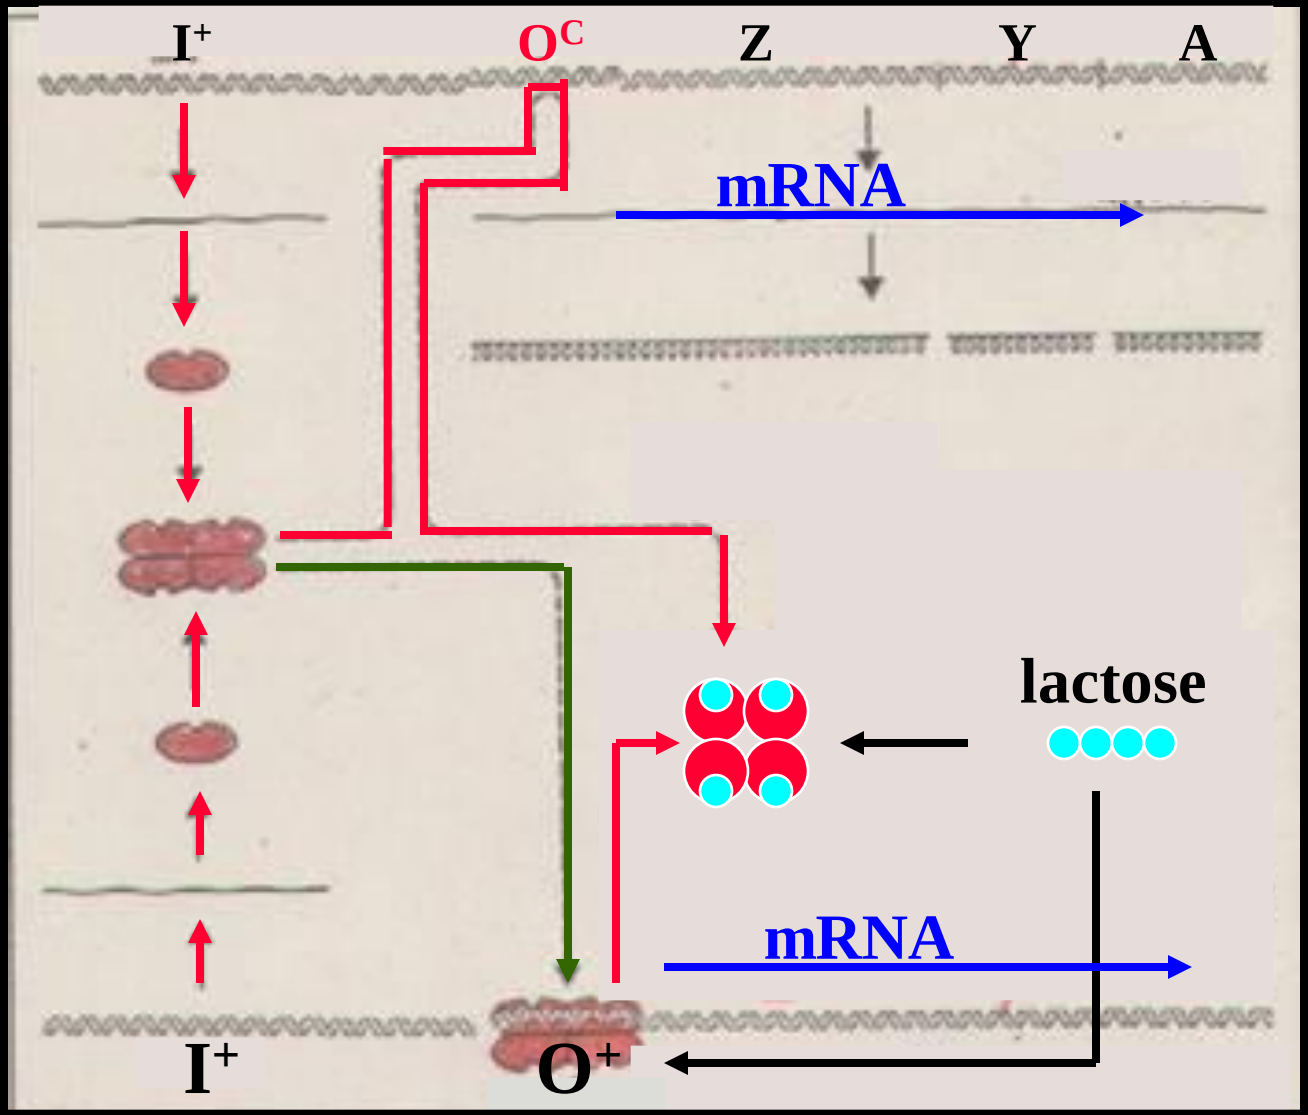
I^S/I^+

$i^S > I^+$

$i^S > i^C$

等位基因间的显隐关系

(Source:Molecular Biology(2002),Robert F.Weaver,Page178）



O^C失去与repressor特异结合的能力

$O^C > O^+$

cis-dominant

等位基因间的显隐关系

cis-dominant

The ability of a site (cis-factor) to control adjacent gene irrespective of the presence in the cell of other alleles of the site.

cis acting factor 对与其紧密连锁基因的控制效应不受其等位基因的影响。

•Positive—inducible operon (多为分解酶类)

I → inactive expressor

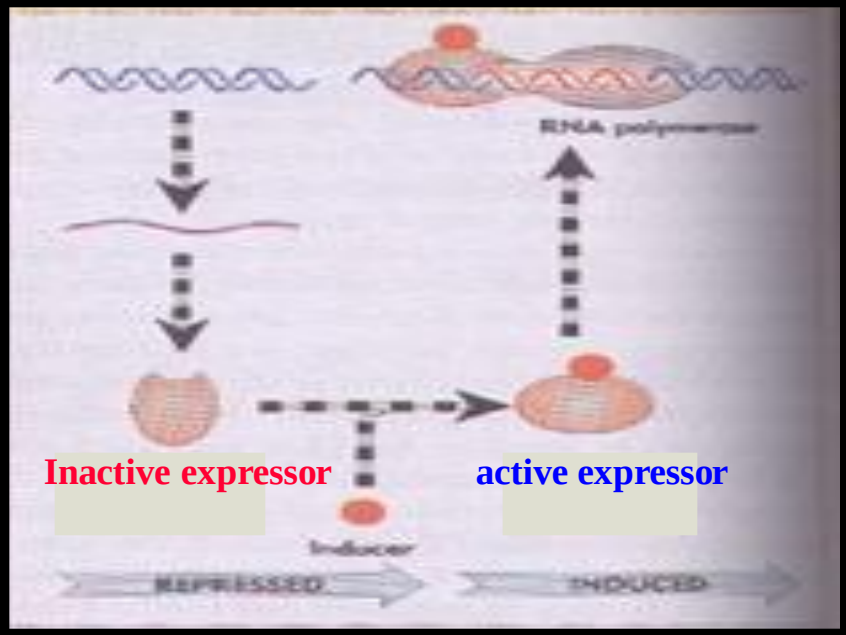
(apoinducer诱导蛋白)

inducer → operon off

active expressor

↓

binding on front P site



(来源：不详)

激活RNA polymerase启动

w.t. ($I^+O^+P^+$) 诱导型

i^S mut. → 超阻突变 (super-repression)

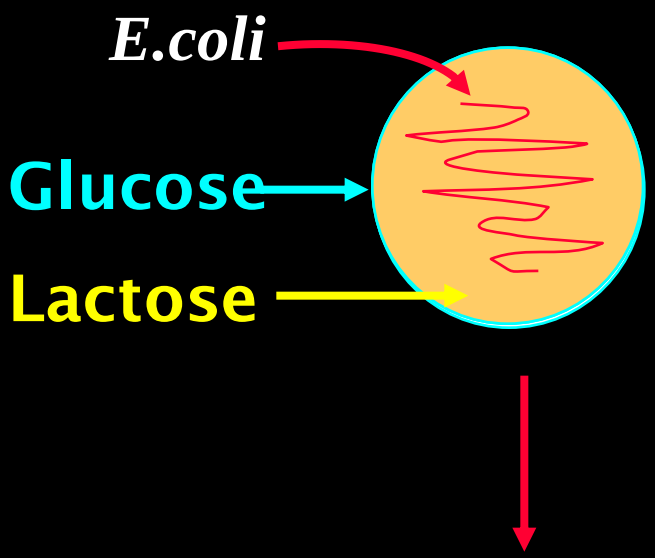
$I^+ > i^S$

↓

expressor can not be activated by inducer

operon off

e.g. cAMP control (universal controlling system)



(Source:Molecular Biology(2002),Robert F.Weaver,Page173）

自然选择形成；--- λ ➡ host ➡ RNApol. binding P_RO_R

early stage ⬅ CRO-p

---CRO-p binding OR3 ➡ off P_{RM}

具有选择lytic 趋势

如果*cI*先表达则建立溶源态，如果cro胜出则被侵染的细菌会裂解。

如果*cI*基因产生足够多的阻抑物，那么这些蛋白会结合到O_R和O_L上阻止早期基因的进一步转录

如果产生了足够的CRO蛋白，它会阻止cI基因的转录从而阻碍溶源态的建立。

什么因素决定是cI还是cro在竞争中胜出呢？

CII的浓度

CII的浓度越高，就倾向于形成溶源态

控制着CII的浓度

细胞内蛋白酶的浓度（HFL）

培养营养环境因素

为什么λ噬菌体又要选择溶原途径作为自己生活周期的一种方式呢？

选择溶原途径又具有什么生物学意义呢？

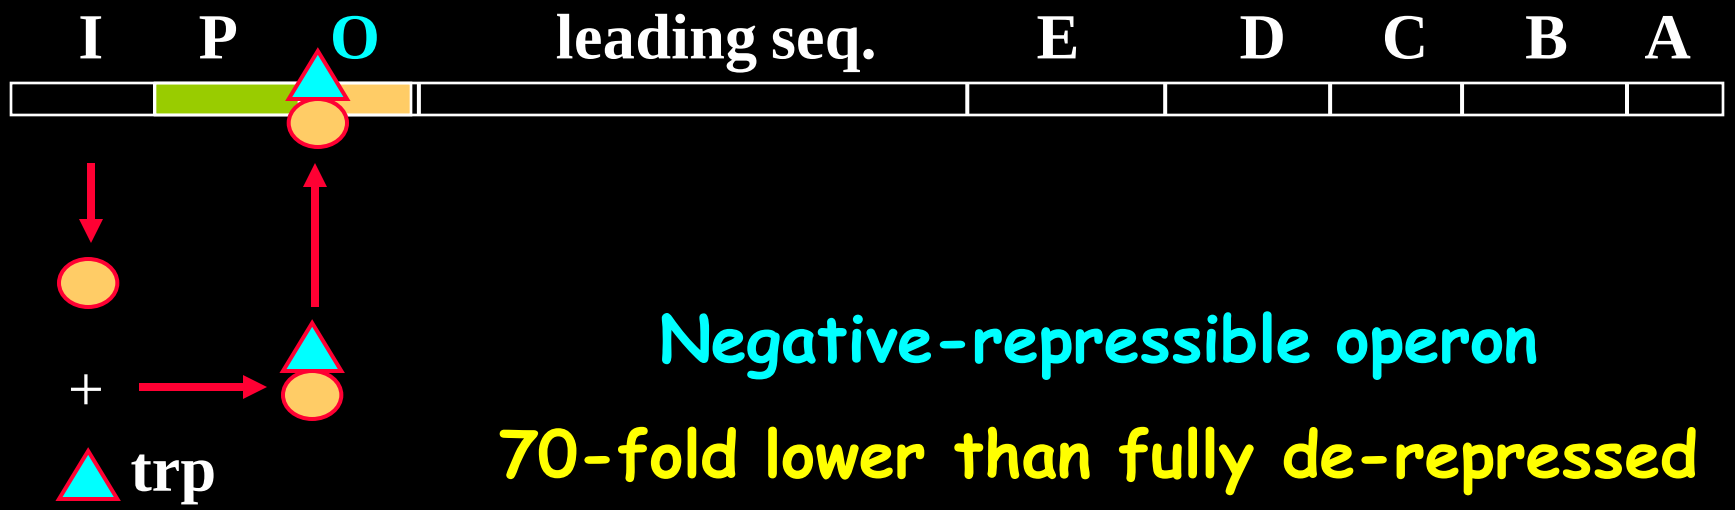
6.1.2. Attenuator control

a) discovery

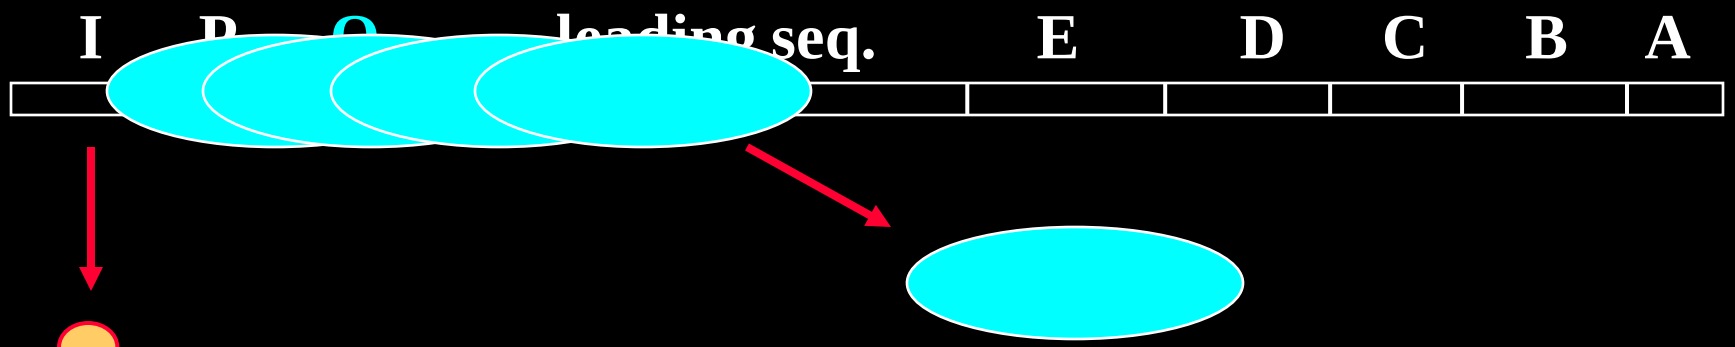
- *E.coli* trp synthetase operon (C. Yanofsky *stanford Univ.*)



Negative-repressible operon

70-fold lower than fully de-repressed

- 1968. Imamato Lab.



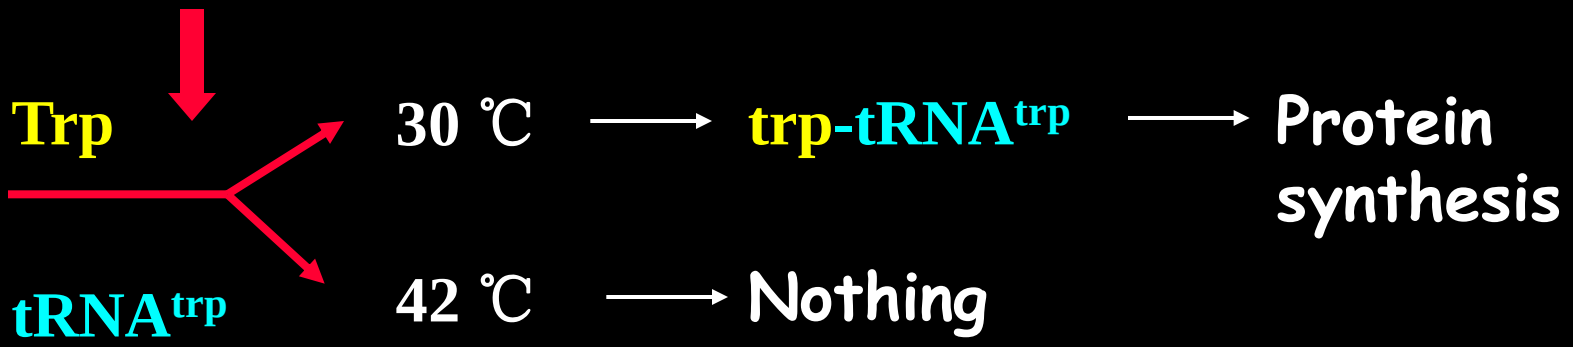
\+ → the complex can not bind with the O site

Low trp

When trp level is low, RNApol moves but falls off in the L.S. and the transcription of the structure genes is blocked.

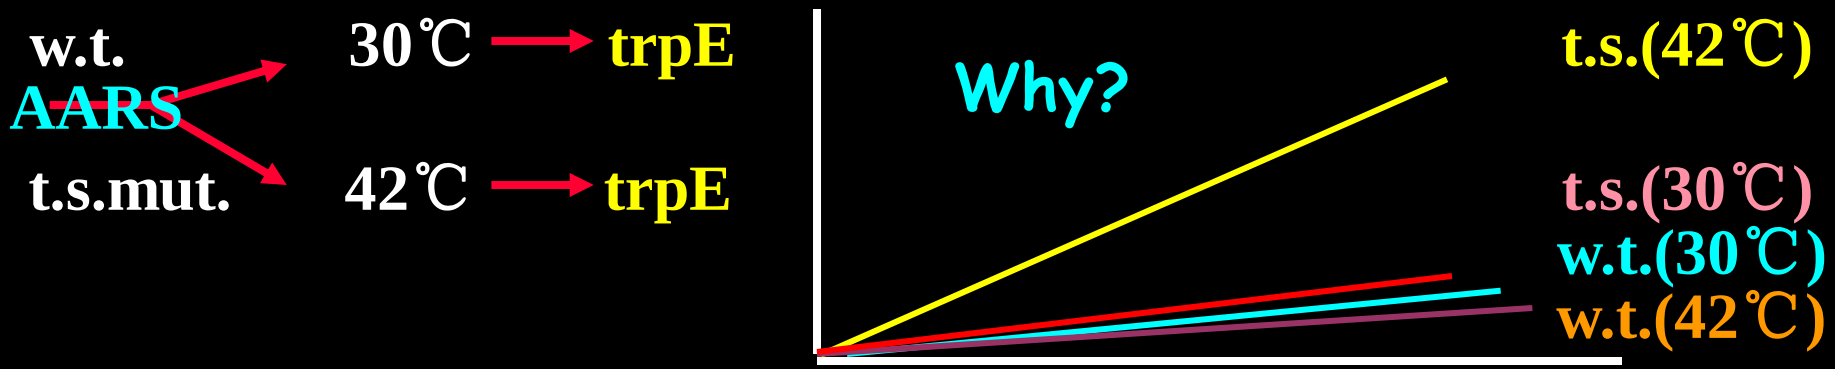
- 1975 Imamato Lab.

E.coli trp-AARS (t.s)



Low trp , operon open

trpE



- t.s.(42℃) AARS inactive

→ no trp-$tRNA^{trp}$ synthesis

RNApol move past L.S

→ transcript of trp synthetase RNA

(E enzyme level is high）

- t.s. (30℃), w.t.(30℃), (42℃) AARS active

→ synthesize trp-$tRNA^{trp}$

RNApol break off at L.S.

→ no transcription of trp synthetase RNA

（ E enzyme level is low）

Conclusion:

---When trp and/or trp-tRNA^{trp} exist in cells,

there is no synthesis of trp

(Fine-tuned control)

--- t.s.(42℃) no AARS and trp-tRNA^{trp},

but take for no trp by error,

（initiate the transcription of trp synthetase RNA)

---trp-tRNA^{trp} is the main factor leading to RNApol. falling off at L.S.

- **Fine-tuned regulation within the leading sequence**

I po L.S. E D C B A

When trp is rich,
B activity detected

genotype	I^+	i^C
Trp Δ ED	0.17	11.8
Trp ΔL.S.ED	1.32	100

?

I^+; operon off low E activity

i^C; operon on high E activity (~70X)

The difference of E activity of Δ ED &ΔL.S.ED (~10X) results from the L. S.

Controls the operon over a 700-fold , range from fully inactive to fully active

0.17 100

- **leading seq with cis-acting domain**

Partial diploid test（trp rich）

Genotype		E activity	A activity
trpi^C	L.S. E D C B A	1.4	14.8
trp $i^C\Delta$ A	L.S. E D C B	1.1	0
trp $i^C\Delta$ E	L.S. D C B A	0	16.5
trp $i^C\Delta$ L-C	B A	0	94
trp $i^C\Delta$ L-C	B A	2.5	102

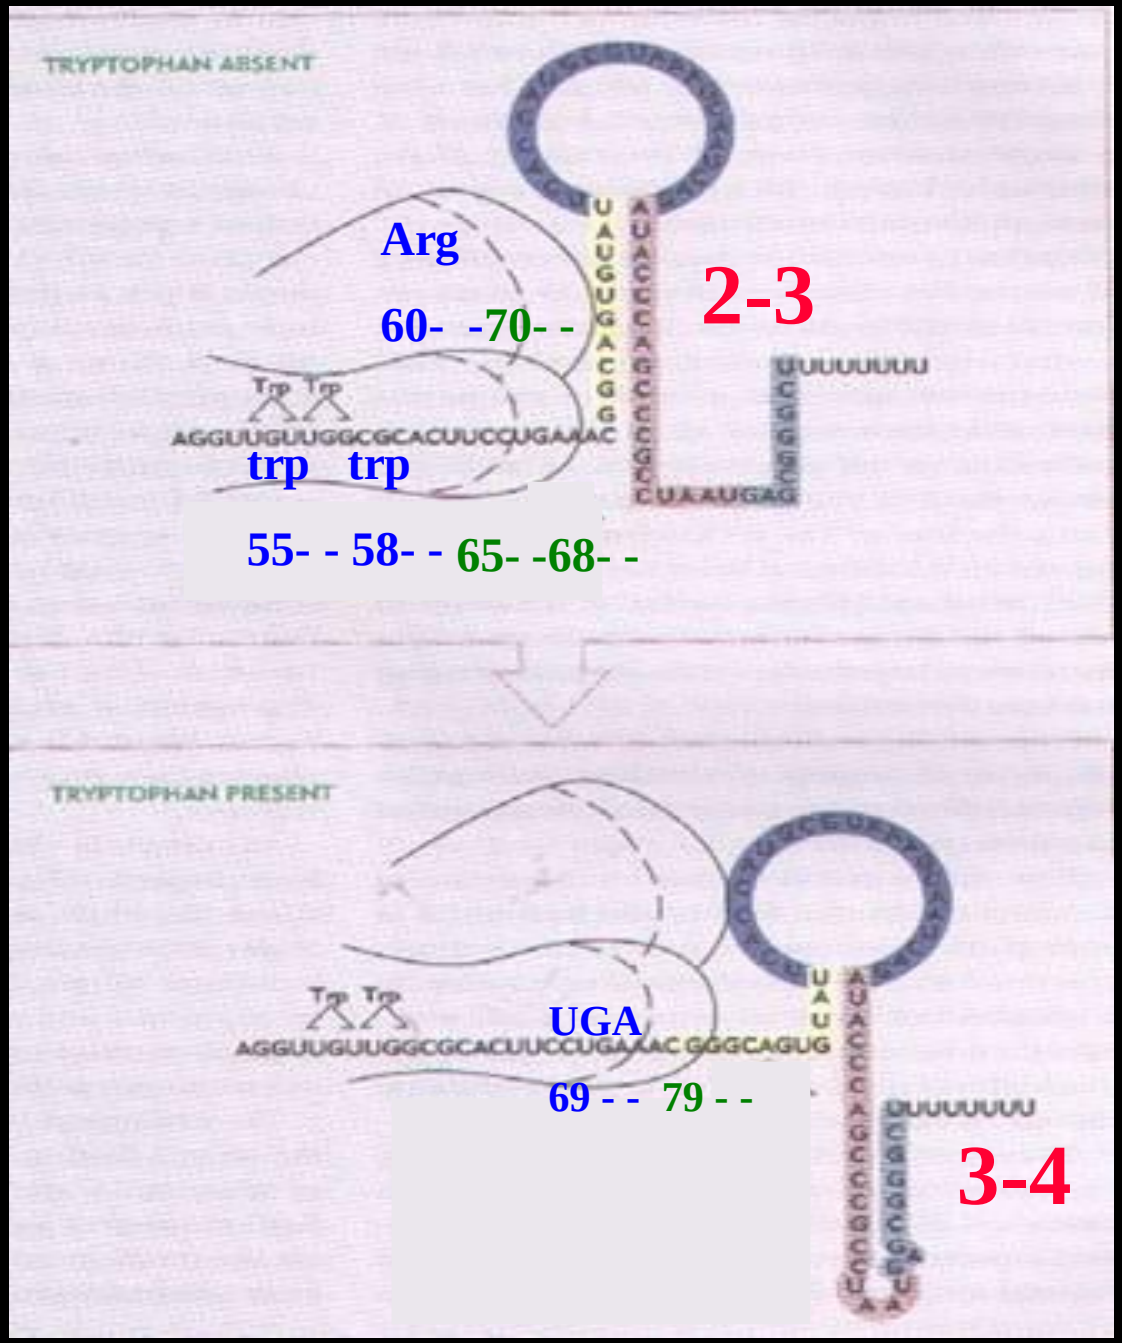
2 - 3

(来源：分子生物学（2007），郑用琏，第228页)



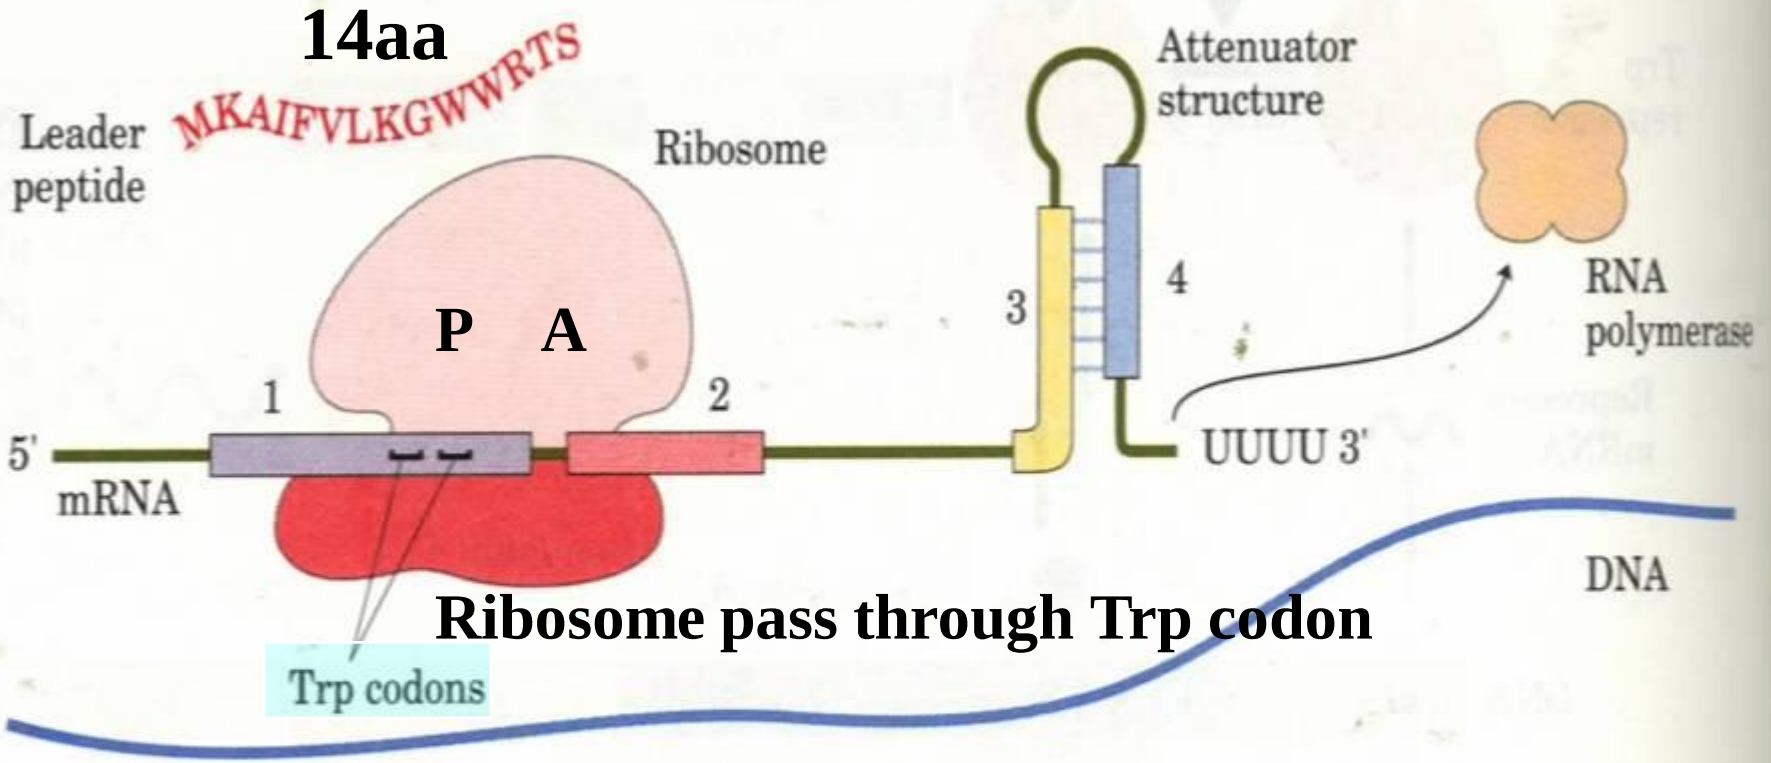
Trp(Arg)

starved

Non-starved

Rho-independent T.

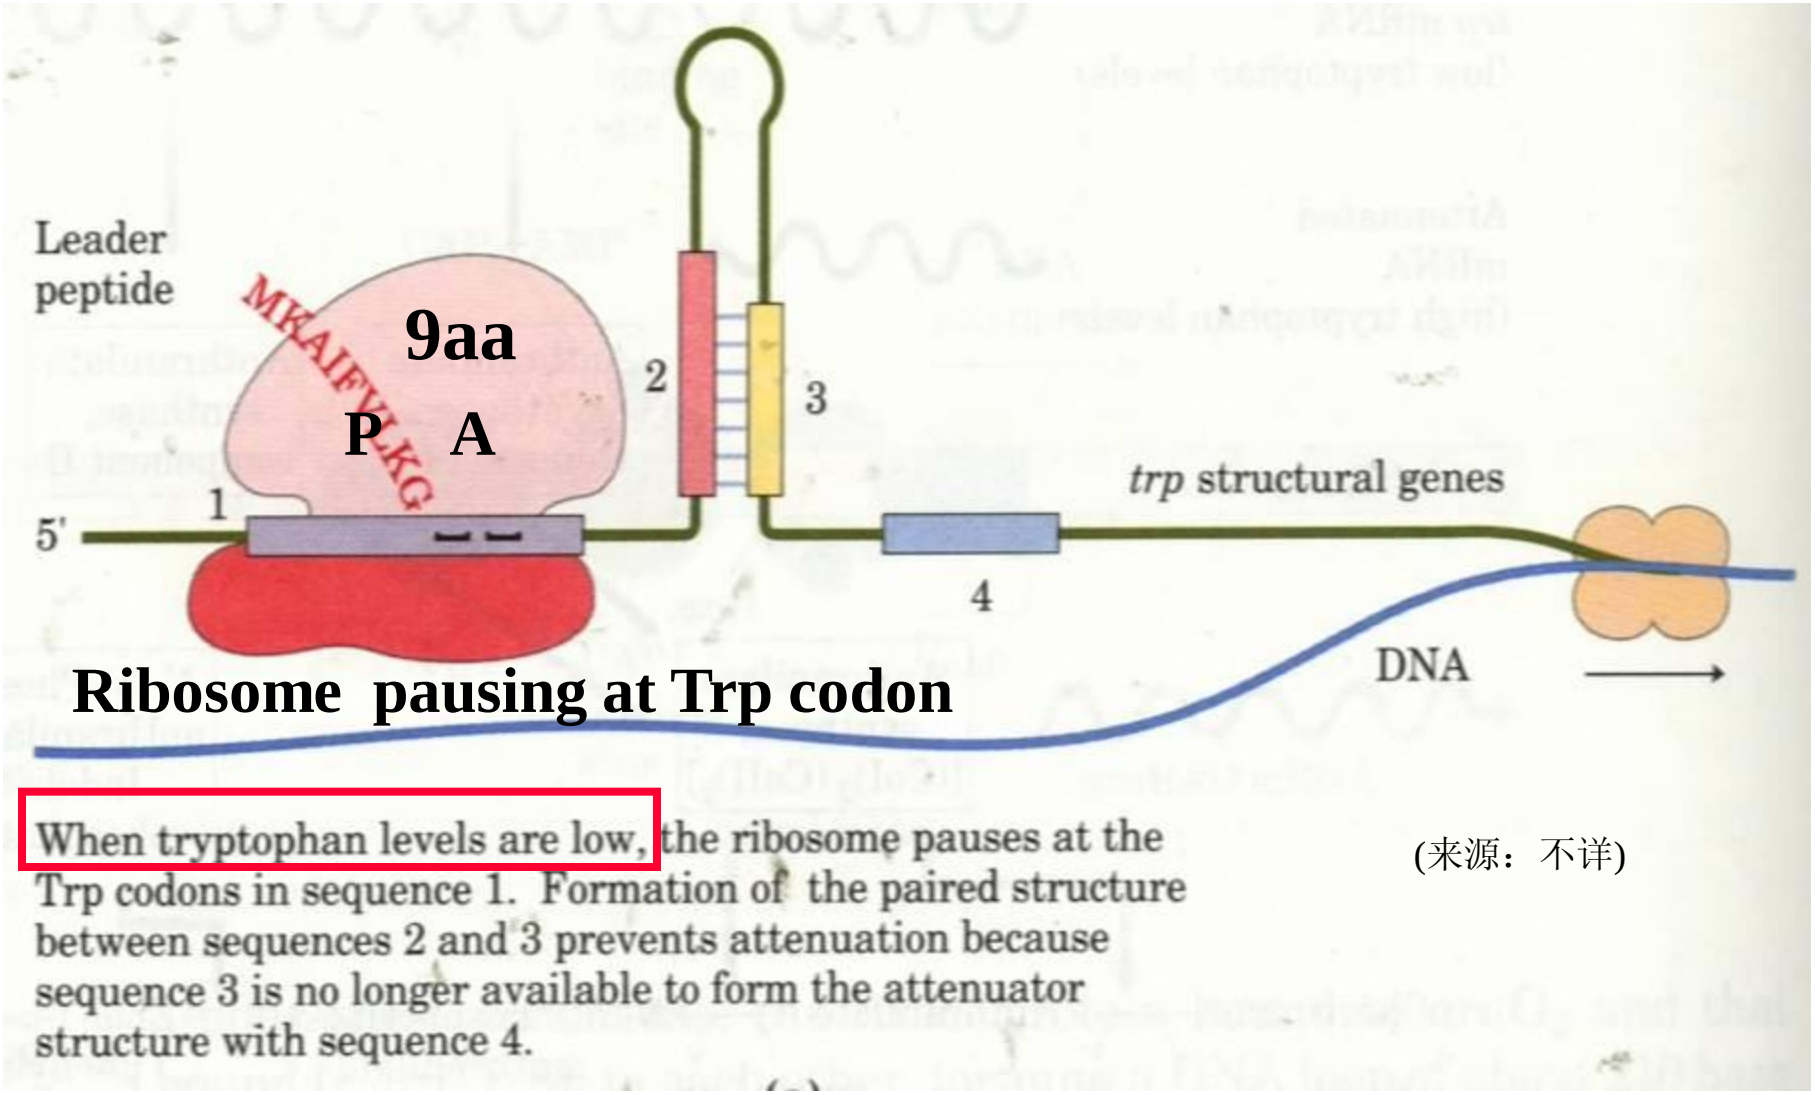
(来源：不详)



Ribosome pass through Trp codon

When tryptophan levels are high, the ribosome quickly translates sequence 1 (open reading frame encoding leader peptide) and blocks sequence 2 before sequence 3 is transcribed. Continued transcription leads to attenuation at the terminator-like structure formed by sequences 3 and 4.

(来源：不详)



Ribosome pausing at Trp codon

When tryptophan levels are low, the ribosome pauses at the Trp codons in sequence 1. Formation of the paired structure between sequences 2 and 3 prevents attenuation because sequence 3 is no longer available to form the attenuator structure with sequence 4.

(来源：不详)

e) The biological significance of Attenuation control

When trp level is low →

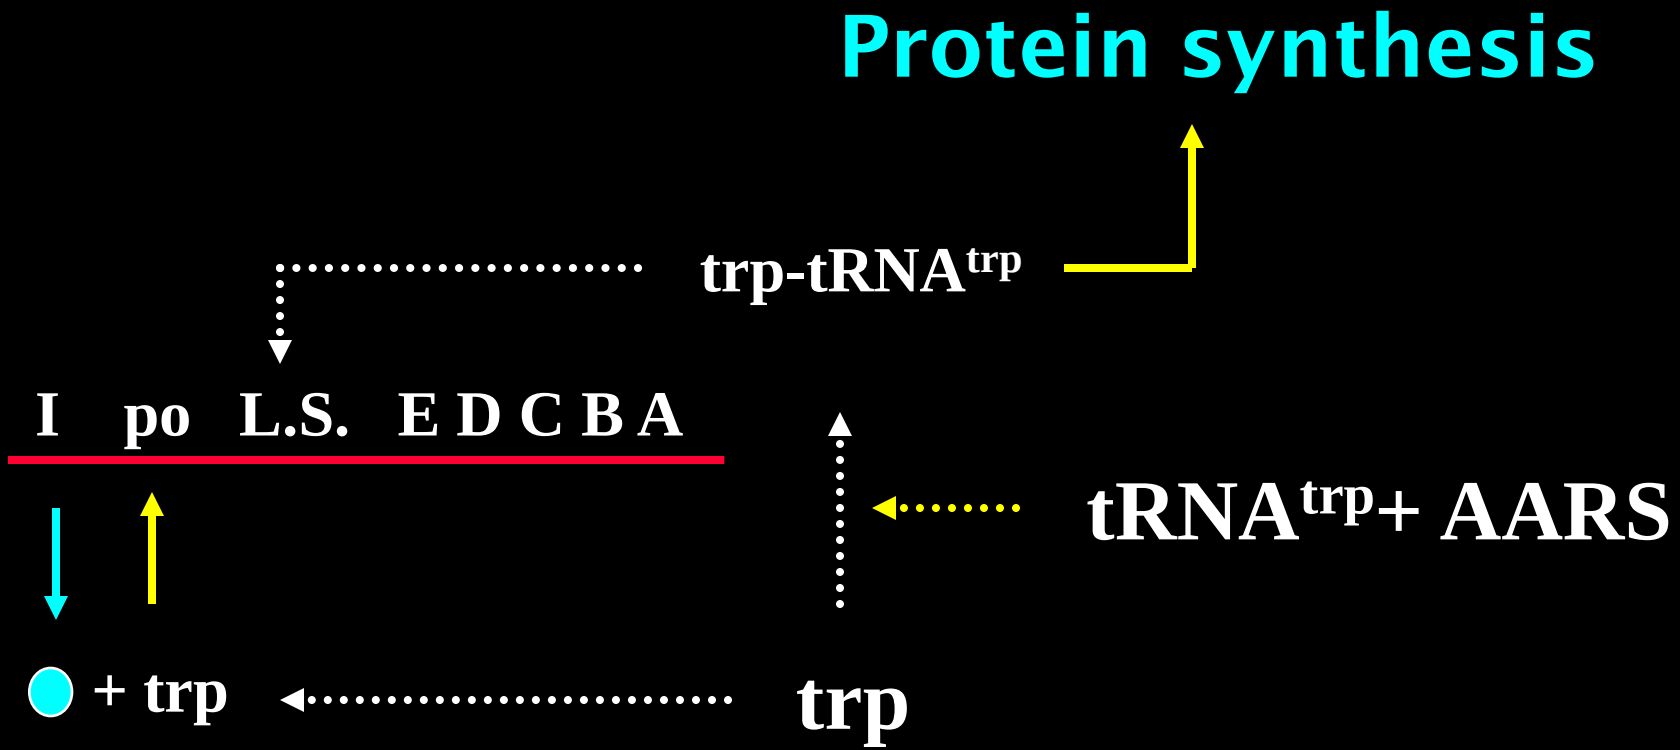
repressor is not enough to close operon

When trp level is high →

little RNApol. Pass through the O site

↓

If anly **trp-tRNA^{trp}** exist in cells, Attenuator will interrupt the RNApol. transcription in the L.S.



Trp synthetase opron

biological significance

The fine-tuned regulation in the Prokaryotes

Enhance the adaptability of prokaryotes to the environment

The mechanism of Attenuation control

Control the transcription of the operon finely via the translation of the short peptide coded in the L.S.

电穿孔、基因枪 → ***plant cell*** } **RNA interference**

RNAi 定义

外源或内源性的双链RNA (dsRNA) 进入细胞后引起与其同源的mRNA 特异性降解，抑制相应基因表达，表现出特定基因缺失表型的现象。

RNA干扰抑制基因表达的基本原理

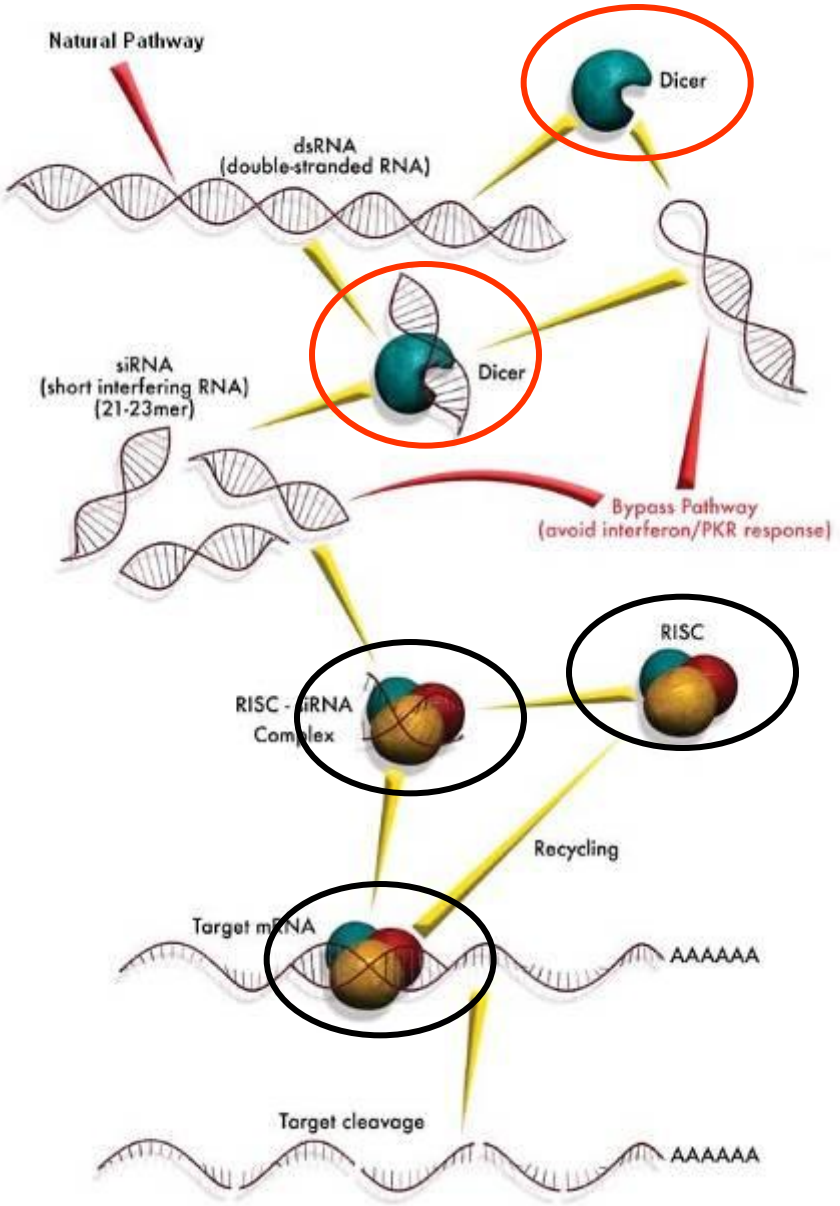
双链RNA (dsRNA) 通过细胞膜进入细胞内, 在Dicer (RNA 酶Ⅲ家族中的一种序列特异性的核酸内切酶) 的作用下, 被切割为21～22bp , 3’端带有2～3nt 末端突出的双链RNA 分子, 这种小的双链的RNA 分子被称为小干扰 RNA (small interference RNA ,siRNA) 。

RNA干扰抑制基因表达的基本原理

siRNA 同相关的酶结合, 形成RNA 介导的沉默复合物 (RISC RNA-induced silencing complex) , RISC在ATP 供能的情况下, 将其 携带的双链 siRNA 变成单链 siRNA 分子, 进而成为有活性的RISC。又称为Slicer

RNA干扰抑制基因表达的基本原理

Slicer 同目标靶mRNA 分子结合, 引发目标RNA 分子的断裂, 进而被核酸酶降解, 导致目的基因的沉默。



A model for RNAi.

- **begins with dsRNA, which a cellular nuclease cleaves (Dicer) to fragments 21-23 nt long.**

- **Active RISC (Slicer)**

- **the antisense 21-23-nt RNAs can hybridize to sites in the mRNA and dictate cleavage of the mRNA at or near their ends, usually at a U**

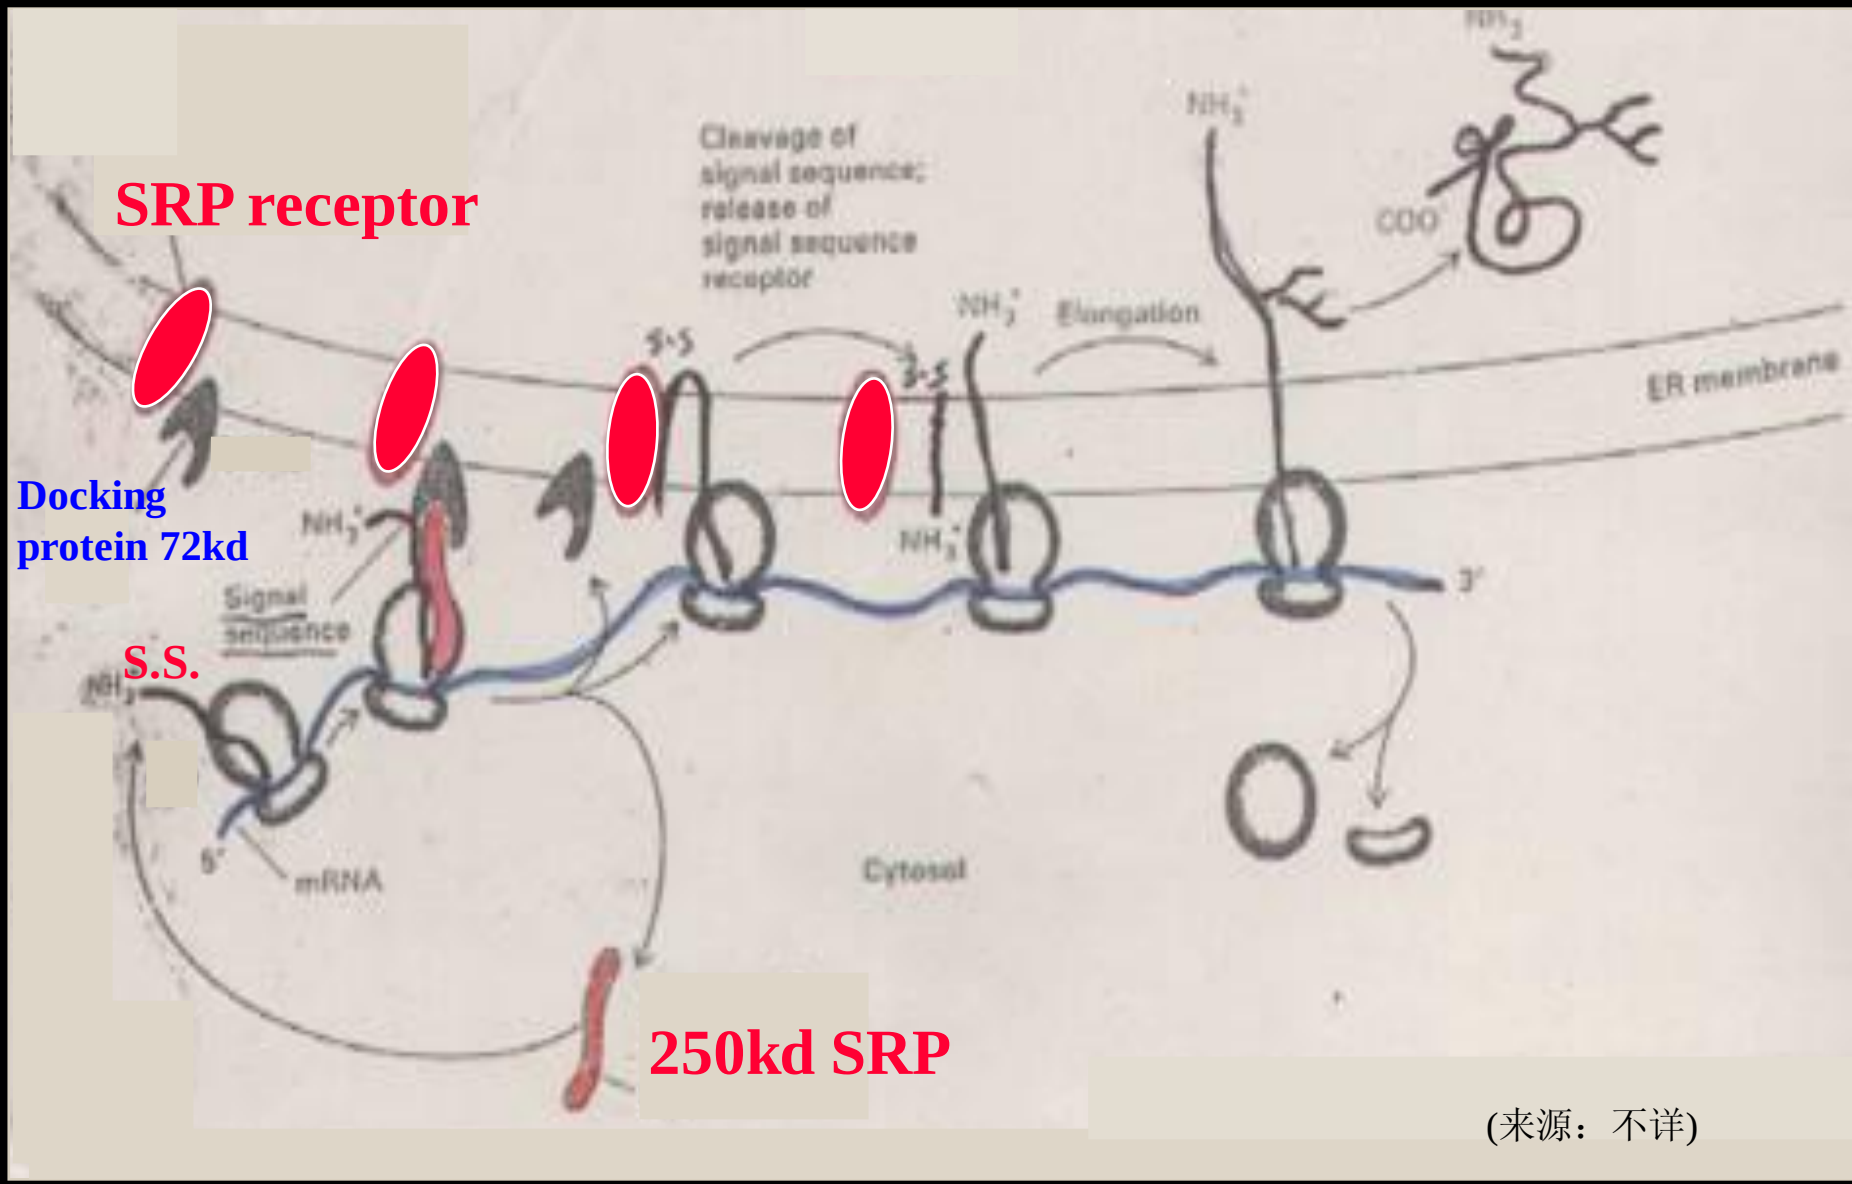
真核生物分泌性蛋白质穿膜的分子模式



(来源：不详)

6.3.2. protein degradation

a) protein degradation 的调控是生理代谢的需要

各类蛋白的半衰期几乎恒定 e.g. in liver cell of mouse

Ornithine decarboxylase	0.2 hr
RNApol A	0.33 hr
Trp oxygenase	2.5 hrs
Ser dehydrogenase	4.0 hrs
RNA polB	12 hrs

结构蛋白，储藏蛋白 → 半衰期长，结构稳定

催化酶类，代谢酶类 → 半衰期短，不断更新

错译蛋白，失活酶类 → 清除隐患，废物利用

b) 蛋白质降解机制

细胞内高度复杂，精细的调控系统

两个主要的蛋白质降解级链反应

- **PCD过程中的Caspase (trigger protein-splitting enzymes)过程**
- 半衰期短和异常蛋白降解的泛素系统

泛素依赖的蛋白质降解途径（ubiquitin dependent proteolytic pathway）又称Ub途径或泛素/26S蛋白酶体通路是生物体最重要的、有高度选择性的降解细胞内短命调控蛋白的重要调节途径。

泛素/26S蛋白酶体通路的发现

- 1953年 Simpson

  发现生物细胞分解细胞自身的蛋白质是需要消耗能量的（Simpson, 1953）。
- Aron Ciechanover、Avram Hershko、Irwin Rose 在20世纪70年代末至80年代初

  提出了泛素在蛋白质分解中所起的基本作用的假说——“多重步骤泛素化标签假说”

The Nobel Prize in Chemistry 2004

The Nobel Prize in Chemistry 2004

The Royal Swedish Academy of Sciences has decided to award the Nobel Prize in Chemistry for 2004 "for the discovery of ubiquitin-mediated protein degradation" jointly to Aaron Ciechanover, Avram Hershko and Irwin Rose

Inactive Chromatin

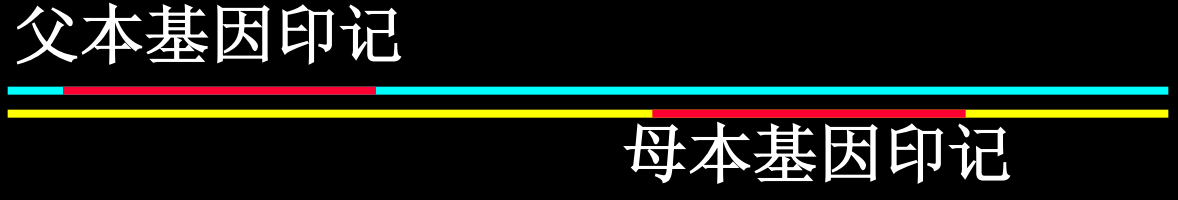
Genome / gene imprint

- **Genome imprinting affects a small subset of genes and results in the expression of those genes from only one of the two parental chromosome**
- **This is caused mainly by differential methylation of the two parental alleles of the imprinting gene and trans-action of small RNA**

*Genome / gene imprint*的特点

- 合子及幼胚期，DNA去甲基化程度高，gene imprint被抑制，表现了细胞的“全能性”

- Genome imprint具有染色体区域性或整体性
- 染色体区域性印记中相邻印记基因具有“相反”的印记作用模式



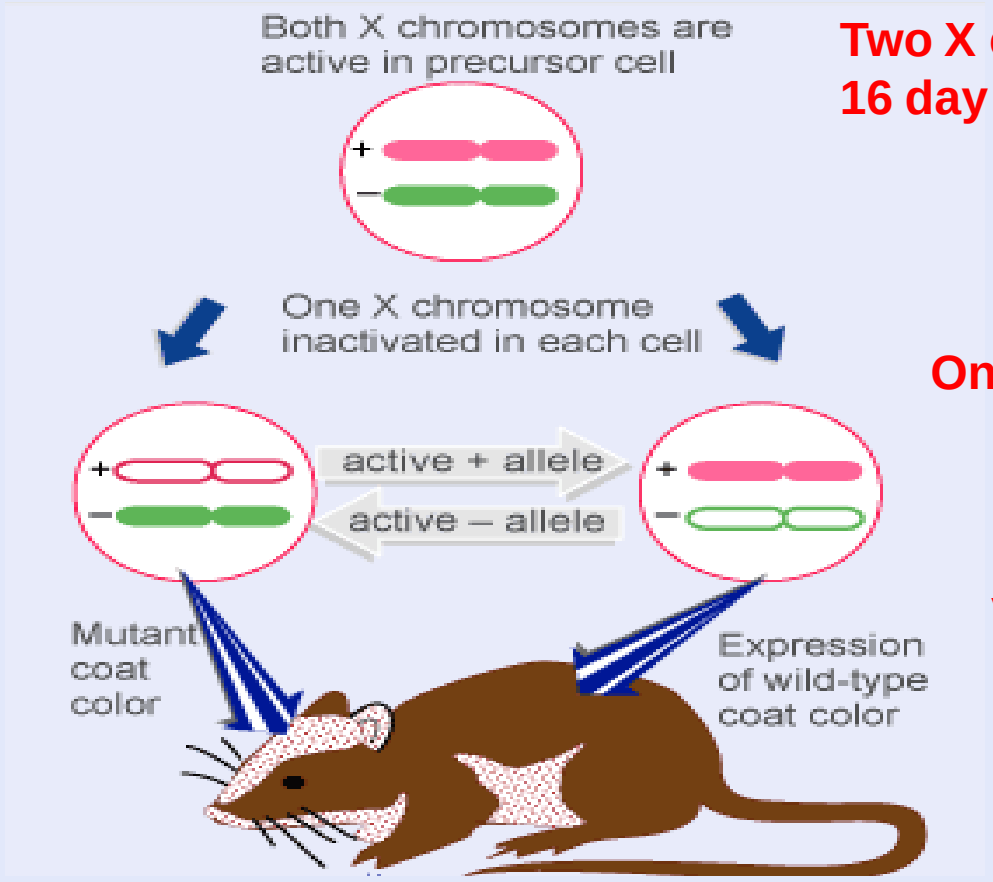
Genome / gene imprint表现的特点

- 印记现象具有组织细胞的特异性

- 基因印记的发生常与该基因的编码区，启动子区及其上下游的CpG序列甲基化相关

- 印记效应会因去甲基化而消失
  (水稻白叶枯病成株抗性？)

One X chromosome is inactived at random



Two X chro. Euchromatin in 16 day precursor cell

One X chro. inactived at random

Variegation

- 被异染色质化的X染色体—常染色质化

  导致雌性哺乳动物宫颈癌，胃癌

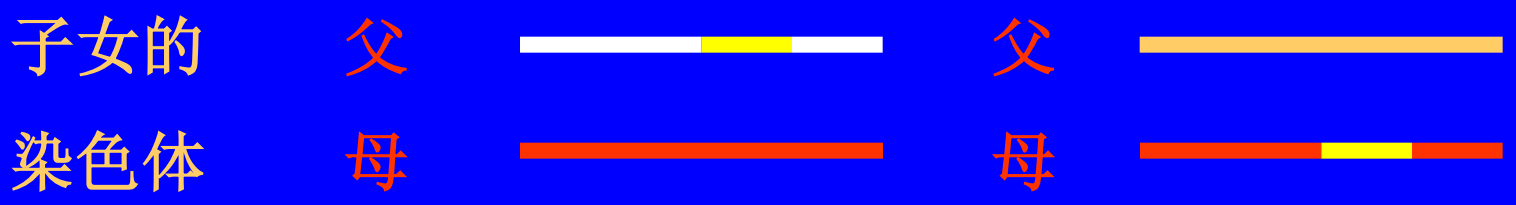
  Argelmen症（**Ag**）：平衡性差、过分兴奋与发笑

共同的病因：**15q11-q13** 缺失，基因型相同

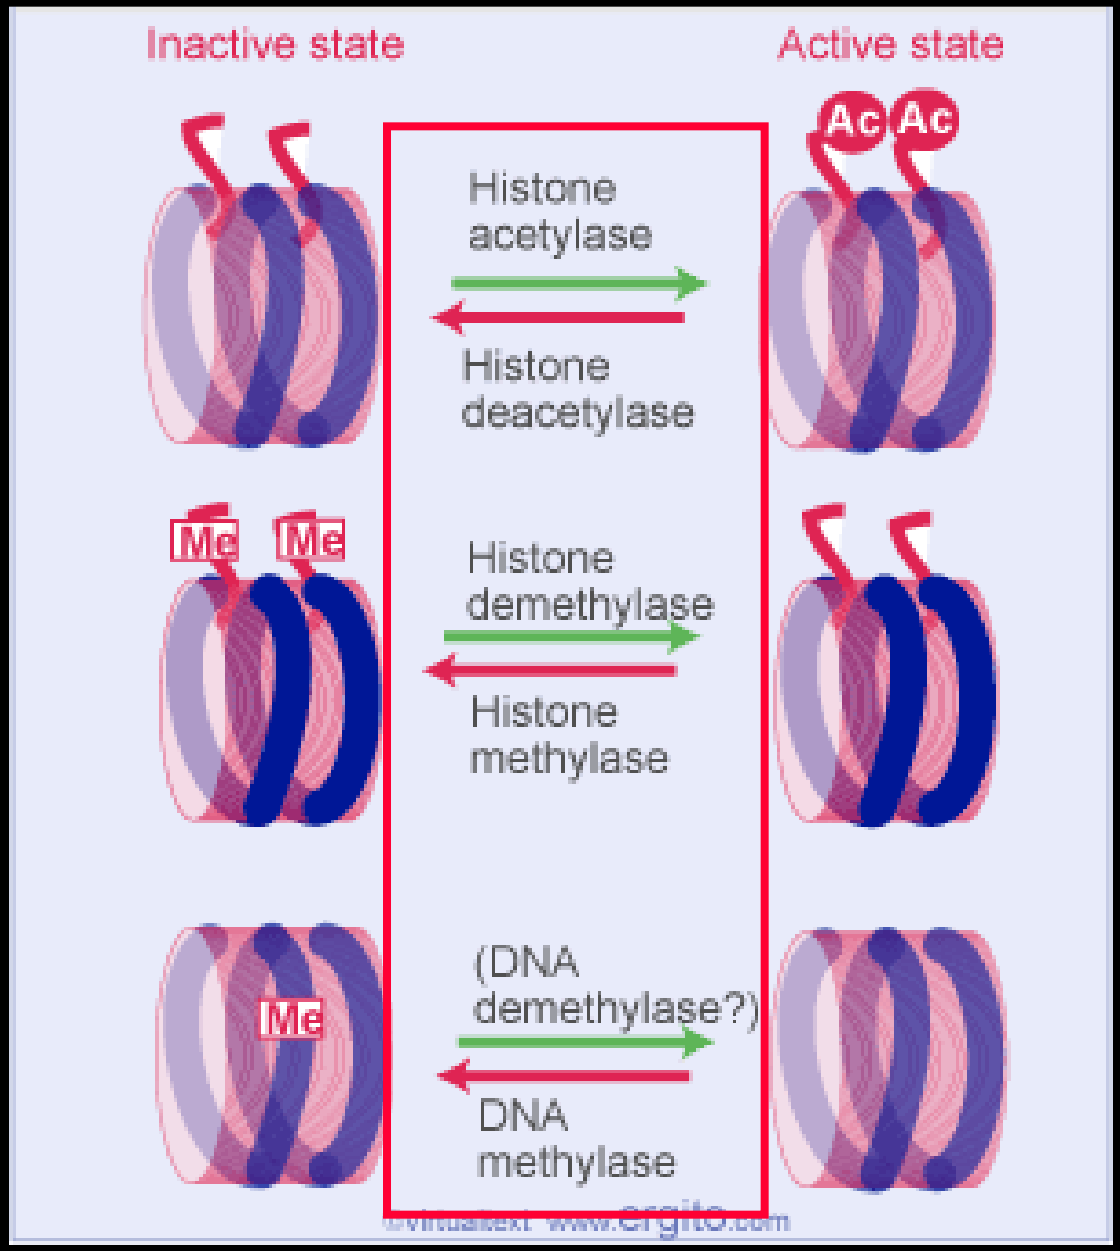


Paternal Dominance of Trans- eQTL Influences Gene Expression Patterns in Maize Hybrids

Ruth A. Swanson-Wagner et al. Science. 1118 (2009);326

We identified ~4000 expression quantitative trait loci (eQTL) that allowed us to identify markers linked to variation in expression. We found that over three-quarters of these eQTL act in trans (78%) and that 86% of these differentially regulate transcript accumulation in a manner consistent with gene expression in the hybrid being regulated exclusively by the paternally transmitted allele.

This result suggests that widespread imprinting contributes to the regulation of gene expression in maize hybrids . We hypothesize that at least some paternally dominant trans-eQTL are small RNAs, because small RNAs regulate gene expression in trans.



3 types of modification affect chromatin

甲基化的CpG序列可招募组蛋白去乙酰化酶，去除组蛋白上的乙酰基团，抑制基因的表达。

microRNA（miRNA），siRNA，

anti-sense RNA...

What is microRNA?

- MicroRNAs are a newly identified class of small single-stranded non-coding RNAs;
- MicroRNAs regulate their target genes via two main mechanisms:

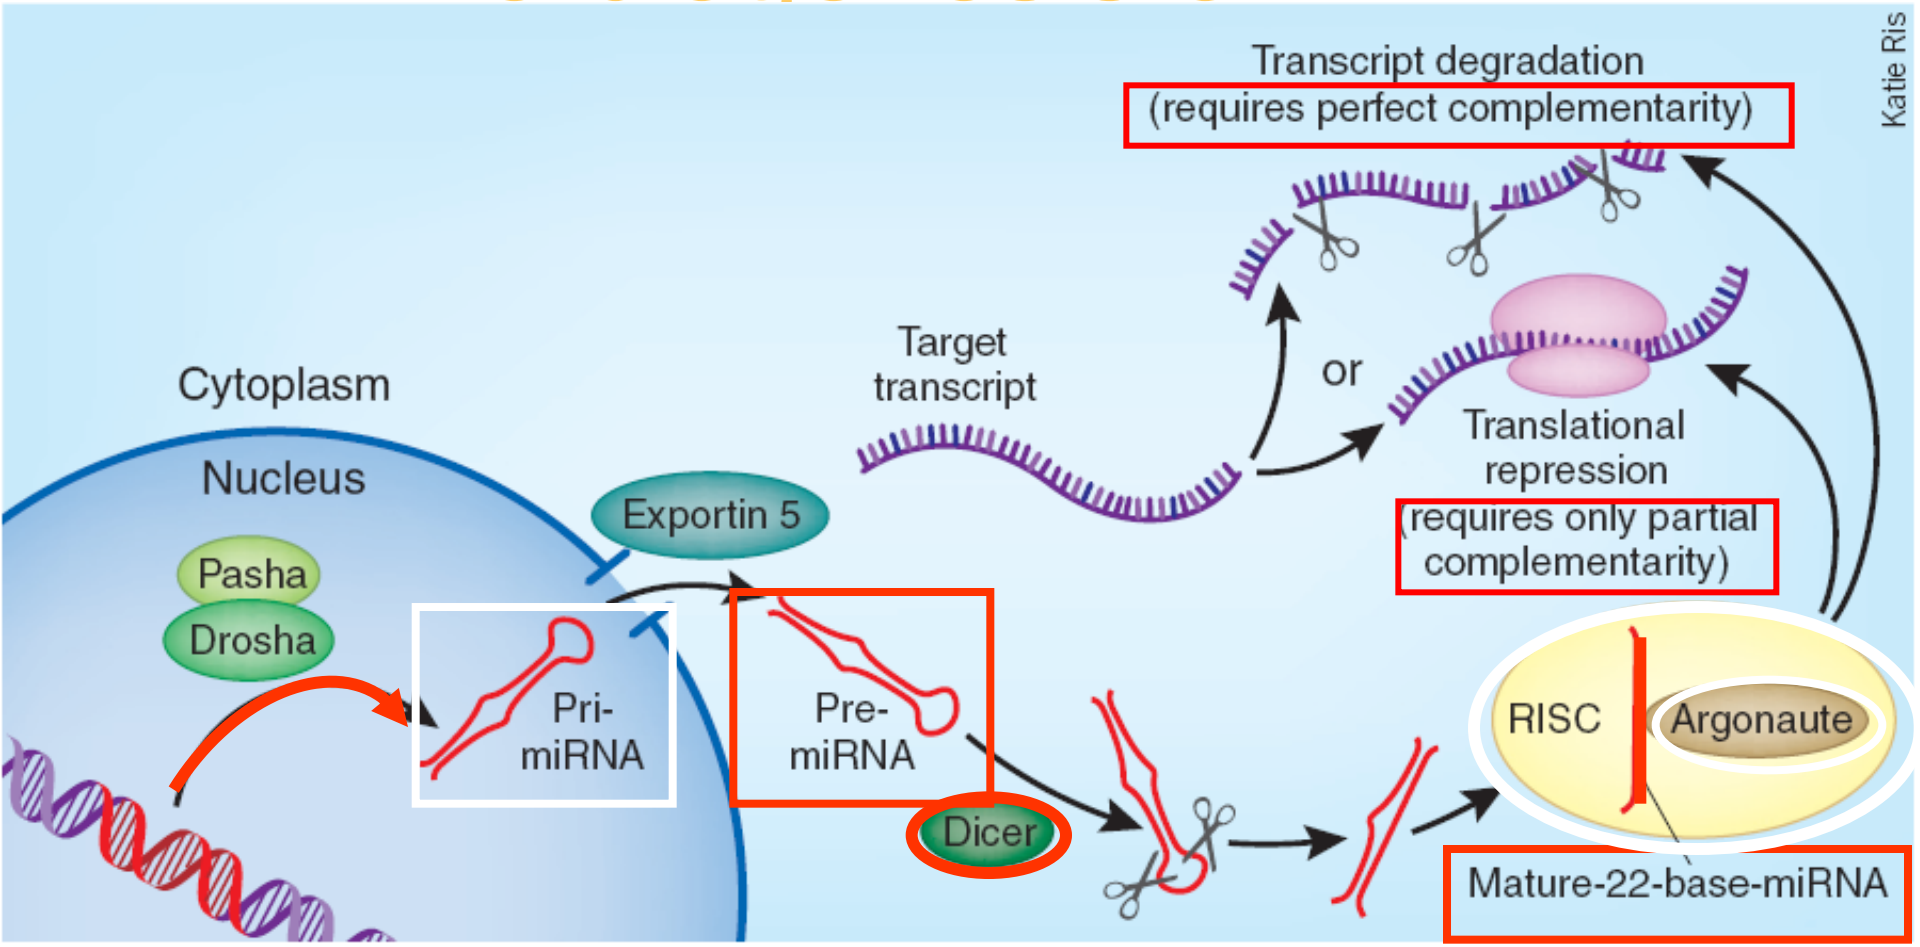
  target mRNA cleavage

  translational repression.

The characters of miRNA

- Length: 18-25nt;
- Single-strand；
- Conserved among species；
- Encoded by internal DNA sequences， which are located in the whole genome, mostly in the interval regions of coding genes,centromeres,or,occasionally in the introns;
- Temporally and tissue-specifically expressed

The biogenesis of miRNA



(Source:Review: Geogre S Mack, Nature Biotech., 2007)

siRNA	miRNA
来源于mRNA，病毒RNA，转座子，外源RNA	来源于基因组内的microDNA、剪切的intron...（内源性）
dsRNA由Dicer加工成21Nt±siRNA，在RDRP的作用下可以扩增，siRNA与靶mRNA来源与同一基因	60－100nt，3‘具有2Nt突起茎环结构的pri－pre--miRNA，由Dicer加工成一条双链的21±miRNA，与靶mRNA来自不同的基因
进入RISC体系降解靶mRNA，转录后水平上沉默基因表达，	与mRNA结合，或剪切mRNA，抑制翻译，沉默基因表达(特别是转录因子)。进入RISC体系，在转录后水平上沉默基因表达
与靶基因完全配对，专一性强	与靶基因可不完全配对，因此可调控若干不同的基因
不同内源siRNA具有较大的差异	在近缘物种间具有较高的保守性

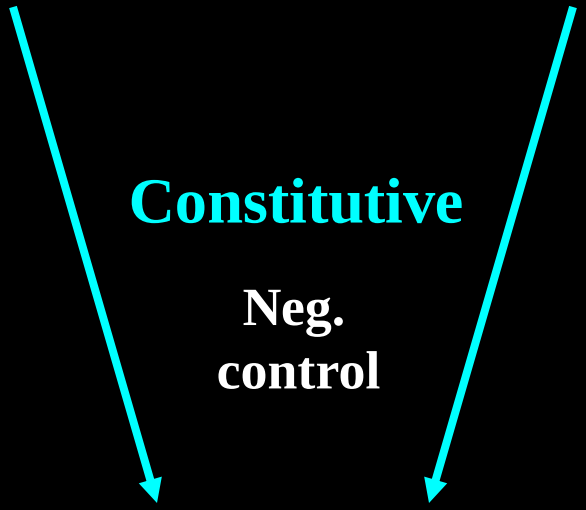
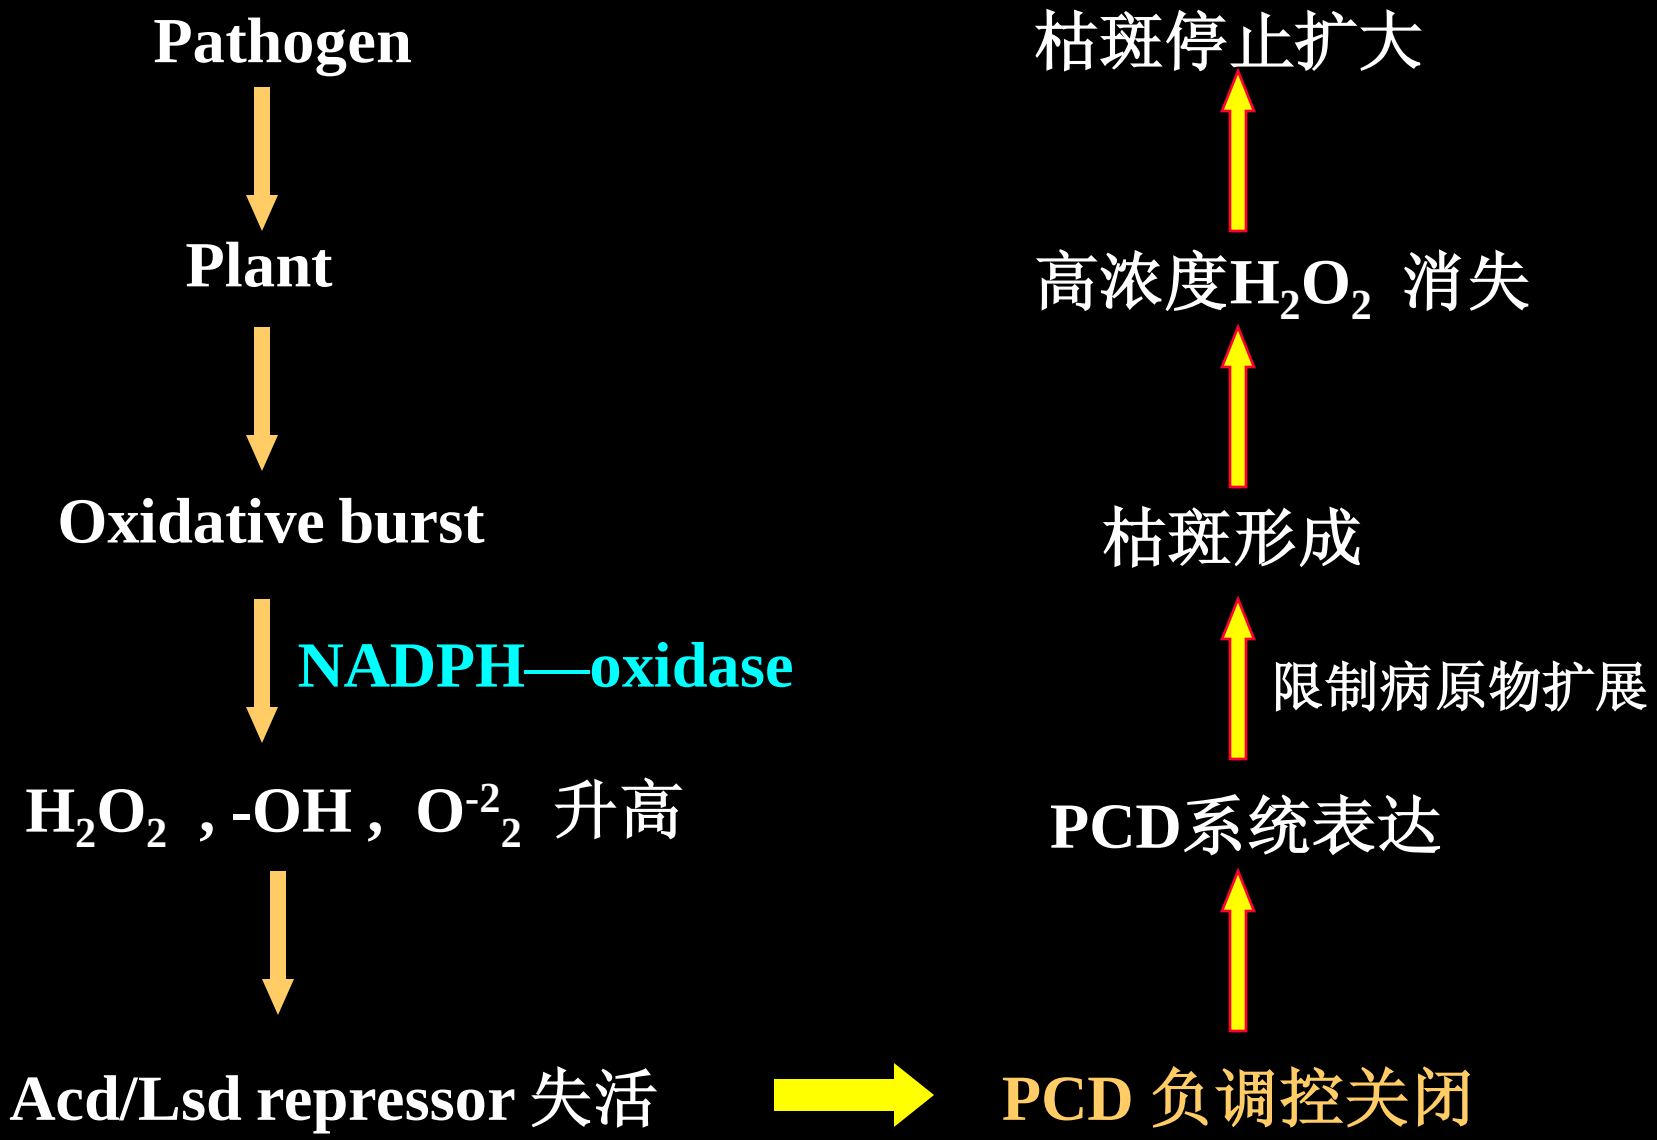
Lsd

(Lesions Stimulating Disease Resistance)

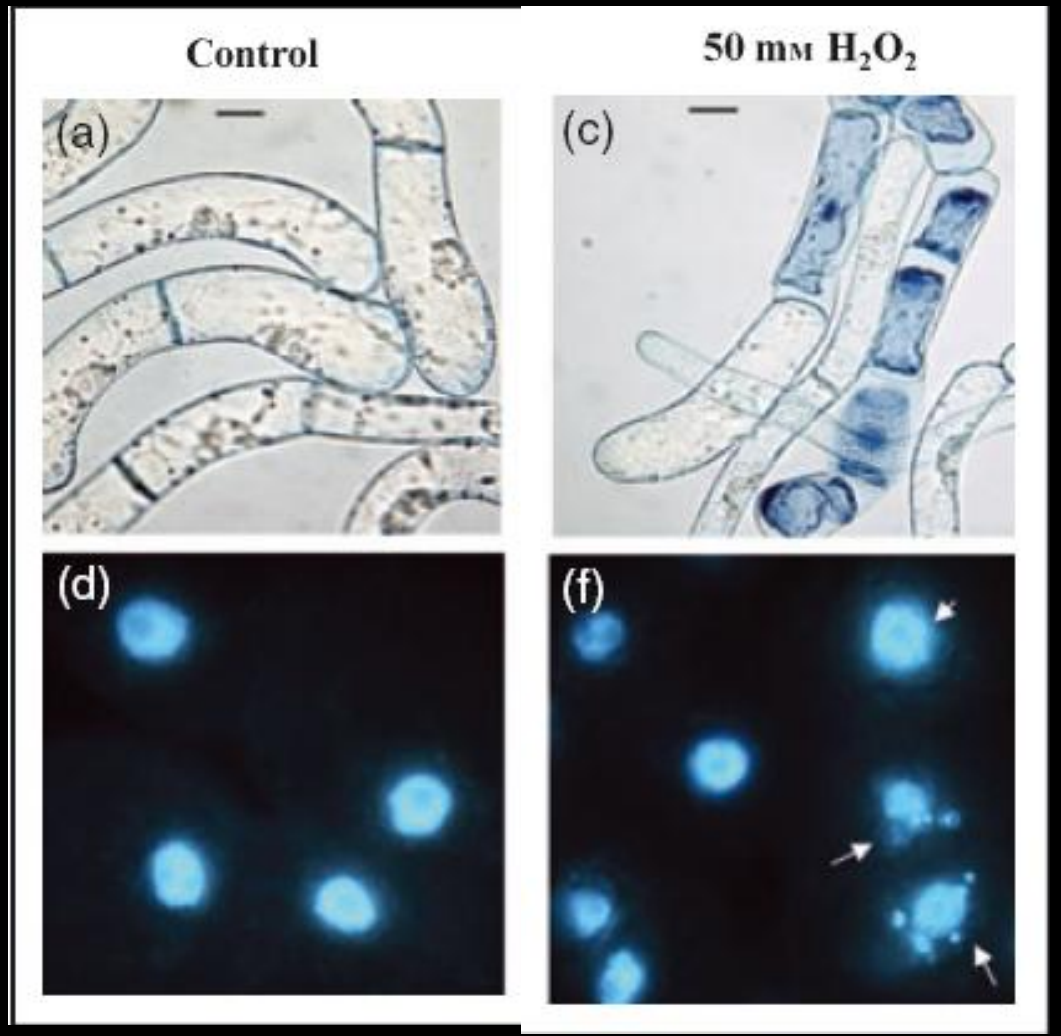


Programmed Cell Death



Pathogen
Plant
Oxidative burst
NADPH—oxidase
H_2O_2 ，-OH，O^{-2}_2 升高
Acd/Lsd repressor 失活
PCD 负调控关闭
PCD系统表达
限制病原物扩展
枯斑形成
高浓度H_2O_2 消失
枯斑停止扩大

H_2O_2 induced cytoplasm shrinkage, a typical marker of plant PCD.



在发育进程中，PCD何时启动？如何决定某一细胞执行PCD?

机体内是否存在真正杀手基因（killer gene）？

Killer只在PCD细胞中表达！
其产物可使细胞走向死亡！

PCD的信号，传递？

PCD的研究方兴未艾

深入研究，揭示生命奥秘
