摘要: 马铃薯淀粉加工过程中产生大量的高浓度酸性有机废水, 直接排放会对环境造成严重污染, 因此, 对马铃薯淀粉加工产生的废水的处理技术受到高度关注。本文介绍和评价了目前国内外淀粉废水的各种处理方法和工艺。 During potato starch processing, a large volume of high-content organic acid wastewater was produced. This could result in serious environmental pollution if the wastewater was directly discharged. As a result, the treatment of potato starch wastewater has become a subject of increasing scrutiny. Various domestic and international methods for treating potato starch wastewater were introduced.
