Sažetak

Small wooden samples of fir (*Abies alba* Mill.) and beech (*Fagus sylvatica* L.) were chemically modified by citric acid (CA) as non-formaldehyde cross-linking system reagent and cured by convection heating at three different temperature regimes. Two different CA solutions were used, one with NaH₂PO₂ and the other with NaH₂PO₄ as a catalyst. The dimensional stability of the modified wood was determined by the anti-swelling efficiency (ASE) using the water soak/oven dry method. Almost equally large improvement of dimensional stability of wood was attained using NaH₂PO₄ as when NaH₂PO₂ was applied as a catalyst.

Ključne riječi

dimensional stability of wood; beech wood; fir wood; chemical modification; citric acid; NaH₂PO₂; NaH₂PO₄
