摘要

采用溶胶-凝胶和射频磁控溅射相结合的方法制备了PZT铁电薄膜。用溶胶-凝胶法制备一层PZT薄膜作为籽晶层，在衬底PZT(seed layer)/Pt/Ti/SiO₂/Si上用射频磁控溅射过量10% Pb的Pb(Zr_xTi_{1-x})O₃(x=0.3)陶瓷靶生长厚500nm的PZT铁电薄膜。采用在450℃预退火, 575℃后退火的快速分级退火方法对PZT铁电薄膜进行热处理。PZT铁电薄膜获得了较好的热释电性能, 热释电系数、介电常数、介电损耗和探测度优值因子分别为 $\rho=2.3\times10^{-8}\text{C}\cdot\text{cm}^{-2}\cdot\text{K}^{-1}$, $\epsilon=500$, $\tan\delta=0.02$, $F_d=0.94\times10^{-5}\text{Pa}^{-0.5}$ 。

Abstract

Lead zirconate titanate(PZT) ferroelectric thin films were prepared by both sol-gel and r.f. magnetron sputtering technologies. In order to decrease the crystallization temperature of thin films and improve the probabilities of nucleus, a PZT seed-layer was prepared by using the sol-gel method. The PZT ferroelectric thin films with about 500nm thickness were sputter-deposited from a Pb(Zr_xTi_{1-x})O₃(x=0.3) ceramic target containing 10% excess Pb on PZT(seed layer)/Pt/Ti/SiO₂/Si substrates. The stepping-annealing with RTP (rapid thermal process) was proposed for theal treatment of the PZT ferroelectric thin films. The PZT ferroelectric thin film showed good dielectric and pyroelectric properties by pre-annealing at 450℃ for 5min and following post-annealing at 575℃ for 5min. The results of pyroelectric coefficient $2.3\times10^{-8}\text{C}\cdot\text{cm}^{-2}\cdot\text{K}^{-1}$, relative dielectric constant 500, dielectric loss 0.02, detectivity figure of merit $0.94\times10^{-5}\text{Pa}^{-0.5}$ were obtained.
