

The microstructure and mechanical properties of the alloy CuZn30 after recrystallisation annealing

<http://www.firstlight.cn> 2010-05-12

Besides bronze, the alloys of copper with zinc and brass are the first alloys accompanying the development of mankind. Nowadays, they are widely applied in technology, and next to light metals they belong to the most commonly used alloys in the group of non-ferrous metals. Thanks to the specific properties of brasses they are applied in various domains of industry, among others in civil engineering, armaments industry, aircraft industry, machine building, the production of motor cars, electrical industry, ship building, precision mechanics.
