摘要: 以薄水铝石、氧化镁、碳酸钠为起始原料,采用传统的固相反应法并添加0.5%--2%的TiO₂促进烧结,制备出高致密度的Na--β"--Al₂O₃电解质,并对不同TiO₂添加量样品的相组成、微结构、力学性能以及电性能进行表征。结果表明,添加TiO₂所得Na--β"--Al₂O₃材料的相纯度高于96%;未添加TiO₂的烧结试样结构疏松,存在大面积孔缺陷,而添加TiO₂的试样显微结构均一,颗粒排布紧密,晶粒生长完善,致密度明显提高。添加TiO₂可以显著提高材料的弯曲强度;添加TiO₂使致密烧结体的钠离子电导率有大幅度提高,其原因是高致密度减小了材料的晶界电阻。

Abstract: The Na-β" - Al₂O₃ electrolyte materials with the relative density of 98% were synthesized by a solid state reaction route employing boehmite Na₂CO₃ MgO as starting materials and TiO₂ as additive and characterized by X-ray diffraction, SEM, bending strength testing and AC 4-probe method. The results show that TiO₂ can promote the sintering performance of Na-β" - Al₂O₃ electrolyte effectively and the purities of β₁ phases were all above 96% when the content of TiO₂ ranging from 0.5%--2%. The obtained samples with TiO₂ dopants comprised of compact and plump grains exhibiting high density with uniform microstructure. The bending strength of the specimen was enhanced obviously with the increase of the TiO₂ additives. The ionic conductivity increased compared with the plain sample due to the decreased boundary resistance of the material.

Keywords: inorganic non-metallic materials solid-state reaction TiO₂ Na-β" - Al₂O₃ solid electrolyte
