摘要:采用气-渣-金平衡法测定CaO-SiO₂-Al₂O₃-MgO-Fe_tO渣系的磷容量,用钼坩埚作为反应容器,Ag-0.2%P合金作为气-渣-金平衡的熔剂,CO-CO₂-Ar混合气体提供体系的氧分压,分析了温度和气氛对该渣系磷容量的影响。结果表明,对于一定成分的炉渣,当体系CO、CO₂、Ar组成一定时,随着温度由1 723 K增加到1 823 K, CaO-SiO₂-Al₂O₃-MgO-Fe_tO渣系的磷容量降低;在1 773 K, 气氛中氧分压由 3.6×10^{-5} Pa增大到 7.2×10^{-4} Pa时,磷容量随着氧分压的增大而增大。

Abstract: Abstract: The phosphorus capacity of CaO-SiO₂-Al₂O₃-MgO-Fe_tO slags was measured by equilibrating the slags in a molybdenum crucible with CO-CO₂-Ar gas and Ag-0.2%P alloy. The effects of temperature and gas pressure on phosphorus capacity were analyzed. The results show that for the slag with constant compositions, under the condition of fixed CO, CO₂ and Ar constitution, the phosphorus capacity decreases with increasing temperature from 1 723 K to 1 823 K; the phosphorus capacity rises with the increase of oxygen pressure from 3.6×10^{-5} Pa to 7.2×10^{-4} Pa at 1 773 K.

Key words: CaO-SiO₂-Al₂O₃-MgO-Fe_tO slag; phosphorus capacity; gas-slag-metal equilibrium method
