摘 要：

针对时分复用光纤光栅(TDM-FBG)传感阵列中使用的分布反馈(DFB)激光器高波长稳定度的要求,设计了一个高精度的DFB温控方案,包括温度测量与设定、热敏电阻线性化、PID补偿回路、H桥驱动、温度电压采集与显示等。使用DFB内置的热敏电阻和半导体制冷器(TEC)对温控电路进行了测试,其精度在200s内达到 $\pm 0.04^{\circ}\text{C}$,温控后激光器温度变化引起的应变测量误差为 $\pm 3.4\mu\text{e}$ 左右,满足TDM-FBG传感阵列的要求。

Abstract:

In order to meet high wavelength stability of DFB in time division multiplexing fiber Bragg grating (TDM-FBG) sensing array, temperature control circuits of DFB are designed, including temperature measurement and set circuits, thermistor linearization, H-bridge driving circuits, PID compensation network, temperature voltage sampling circuits and display circuits. The parameters of DFB's temperature control circuits are tested by using the built-in thermistor and TEC, its accuracy can reach $\pm 0.04^{\circ}\text{C}$ within 200 seconds. This result shows that the strain measurement error from laser's temperature drift will be $\pm 3.4\mu\text{e}$ after temperature control.

Keywords: fiber Bragg grating; sensing; time division multiplexing; distributed feedback; temperature controller
