摘要:

简要回顾以氨气压缩制冷为复合循环间接空气冷却系统的正循环系统(简称“压缩制冷复合循环间接空气冷却系统”)的构建及工作原理。基于热力学原理拟定了制冷循环热经济性评价方法和评价指标;以蒙东某地亚临界600 MW直冷机组为比较基准,进行了同环境、同容量、同型号但不同低压缸的虚拟压缩制冷复合循环间接空气冷却系统的热经济性评价指标的虚拟计算。从理论上导出了制冷循环年累计产/耗电量比大于1的存在必要条件为转捩温度 $T_t$ 必须高于正/逆制冷循环切换温度 $T_s$ ,且高得越多,热经济性越好;揭示了转捩温度的数值大小与产能和耗能设备的效率密切相关,切换温度与汽轮机排气背压及机组安装地的气象条件有关。

Abstract: The components and process flow diagram of the positive sequence refrigerating of compound cycle air cooling unit (CCACU) was reviewed briefly (henceforth called ‘compressed refrigerating CCACU’). Based on the law of conservation of energy, the thermal economy of compressed refrigerating cycle for high temperature duration was drawn up, the basic economic evaluations were worked out. By taking a subcritical 600 MW unit with DAC(Direct air cooling) system (DAC unit for short) in eastern Inner Mongolia as a benchmark, a CCACU(fictitious unit in brief) which is in possession of the same environment was fabricated, same capacity and same model but different low pressure casing structure with the DAC unit and performed the fictitious computation of economic evaluations for it. The conclusions are that the production/ consumption energy ratio may be greater than 1 even in high temperature duration, the necessary condition for achieving this object is that  $T_t > T_s$  and the higher the better; secondly, the numerical value of  $T_t$  is closely related to the efficiency of energy-producing & energy-consuming equipments, but  $T_s$  is related to the turbine exhaust back pressure and the weather data of plant site.

Keywords: compound cycle air cooling unit (CCACU) thermal economic evaluation switching temperature transition temperature fictitious computation
