摘要 采用多靶磁控溅射仪在室温和衬底温度为300 °C的条件下制备Tb/Fe/Dy纳米多层膜, 研究其磁性能和超磁致伸缩性能。结果表明该纳米多层膜较TbDyFe单层膜有更明显的垂直磁各向异性和更大的矫顽力。尽管纳米多层膜样品具有垂直各向异性, 但仍具有超磁致伸缩性能。特别是衬底温度为300 °C的纳米多层膜样品, 具有Laves相结构的TbDyFe纳米晶体析出, 使得低磁场下磁致伸缩性能有了显著的提高。

### Abstract

Tb/Fe/Dy nano-multilayer films were deposited by multi-targets magnetron sputtering system at room temperature and substrate temperature of 300 °C. The nano-multilayer films have large perpendicular anisotropy and high coercive force than the TbDyFe single layer film, and show giant magnetostrictive effect though they have perpendicular anisotropy. The nano-multilayer film deposited by substrate temperature of 300 °C has enhanced low field giant magnetostrictive effect because the nano-crystalline of TbDyFe with Laves phase structure segregates from the amorphous matrix.

**Key words** [Tb/Fe/Dy; nano-multilayer films; giant magnetostrictive effect](#)  
[perpendicular anisotropy](#)
