摘要:

建立了考虑系统功率平衡约束、发电机组出力极限约束、机组爬坡约束、机组工作死区约束的经济调度模型, 应用反捕食粒子群优化算法求解该模型。求解过程中, 在自适应值罚函数中对相关约束条件加入惩罚因子, 应用修补策略对违反各种约束条件的粒子进行积极修正, 使粒子尽可能地在可行解区域或尽量接近可行解的区域内寻优。算例结果验证了该方法的有效性。

Abstract:

An economic dispatching model, in which the constraints such as system power balance, output limit of generating units, ramp rate limit and dead zone of unit are taken into account, is built and solved by anti-predatory particle swarm optimization (APSO) algorithm. During the solving process, in adaptive value penalty function the penalty factors are added to related constraints and the particles that violate constraints are actively modified by repair strategy to make particles locating in area of feasible solution or to search in the area close to feasible solution area as possible. The effectiveness of the proposed algorithm is verified by calculation example.

Keywords: power system economic dispatching anti-predatory particle swarm optimization (APSO) repair strategy adaptive penalty function
