摘要 利用60 MeV/u ^{18}O 离子束轰击天然铀靶，经多核子转移反应生成重丰中子核素 ^{239}Pa 。用放射化学方法从被照射的靶中分离出镤。借助于 ^{239}Pa 和它的子体 ^{239}U 的 γ 射线观测和分析，鉴别了 ^{239}Pa ，测得 ^{239}Pa 的半衰期为 (106 ± 30) min。长寿命同位素，如 ^{232}Th 和 ^{238}U ，可给出一个测定核合成持续时间的可能性，而中等寿命同位素，如 ^{235}U ，则可给出有关产生函数时间历史的信息。总地说来，通过 $^{232}\text{Th}/^{238}\text{U}$ 、 $^{235}\text{U}/^{238}\text{U}$ 或 $^{244}\text{Pu}/^{238}\text{U}$ 的比率，用公式 $N_A(\Delta)/N_B(\Delta) = (P_A/P_B) f(\lambda_A, \lambda_B, S_0, \lambda_R, \Delta)$ 便可推导出宇宙年龄。由 ^{239}Pa 的衰变途径，可简单叙述 ^{239}Pa 的异常长的半衰期对于宇宙年龄估计的影响。

关键词 鉴别 ^{239}Pa 宇宙年龄

Abstract A nuclide ^{239}Pa was produced via a multinucleon transfer reaction by 60 MeV/u ^{18}O ions bombardment of natural uranium. Protactinium was radiochemically separated from the irradiated targets. ^{239}Pa has been identified by using observation and analysis of γ -rays of ^{239}Pa and ^{239}U as a daughter nucleus of ^{239}Pa . The half-life of ^{239}Pa was determined to be (106 ± 30) min. Long lived isotopes like ^{232}Th and ^{238}U give a possibility of determining the duration of nucleosynthesis whereas intermediate lived nuclei like ^{235}U can give information about the time history of the production function. Generally the universe age is deduced through the ratios of the $^{232}\text{Th}/^{238}\text{U}$, $^{235}\text{U}/^{238}\text{U}$ or $^{244}\text{Pu}/^{238}\text{U}$ with formula $N_A(\Delta)/N_B(\Delta) = (P_A/P_B)f(\lambda_A, \lambda_B, S_0, \lambda_R, \Delta)$. The influence of the novel long half-life of ^{239}Pa on the universe age estimate is simply mentioned by ^{239}Pa decay path.
