摘要:

将高量子效率的磷光材料fac-tris-2-phenylpyridine iridium(III) ($\text{Ir}(\text{ppy})_3$)按不同的比例掺杂到具有载流子传输能力的主体材料poly(N-vinylcarbazole) (PVK)中作为发光层制备磷光电致发光器件。通过对器件发光机制的研究,发现光致发光过程中起主导作用的是Fo^{ster}能量转移机制;而在电致发光过程中,器件的发光性能受Dexter能量转移和电荷陷获2种能量传递形式的影响。器件的I-V-L特性表明: $\text{Ir}(\text{ppy})_3$ 的掺杂比例为5%时,器件的光功率效率最大,能量转移最充分。

Abstract:

The phosphorescent electroluminescent devices were developed by doping different proportions of fac-tris-2-phenylpyridine iridium (III) ($\text{Ir}(\text{ppy})_3$) into PVK as a light-emitting layer. Through the research of the luminescence mechanism, it is found that in the process of photoluminescence (PL), Fo^{ster} energy transfer mechanism plays a dominant role, and in the process of electroluminescence (EL), the two types of energy transfers as Dexter energy transfer and charge trapping affect the luminescence performance. The I-V-L characteristic of the device shows that the light power efficiency is highest and the energy transfer is the most efficient when the doping proportion of $\text{Ir}(\text{ppy})_3$ is 5%.

Keywords: organic electro-phosphorescent device luminescence mechanism Fo^{ster} energy transfer Dexter energy transfer charge trapping
