摘要 采用沉积-沉淀及光还原法制备了 Ag@AgBr 等离子体光催化剂, 利用 X 射线衍射、扫描电镜和紫外-可见漫反射光谱对其进行表征, 并考察了该等离子体光催化剂在可见光 ($\lambda > 420$ nm) 下的催化性能, 探讨了催化剂用量、pH 值、亚甲基蓝初始浓度、H₂O₂ 添加量、循环使用及捕获剂对 Ag@AgBr 催化性能的影响。结果表明, 当亚甲基蓝的初始浓度为 10 mg/L, 催化剂用量为 1 g/L, pH = 9.8 时, 光照 12 min 后, 亚甲基蓝的降解率高达 96%, 且样品经 5 次循环使用后活性基本保持不变; 而少量 H₂O₂ 的添加对光催化活性影响不大, 过量的 H₂O₂ 会降低光催化活性; 乙二胺四乙酸捕获空穴后比异丙醇捕获•OH 后的光催化活性降得更低。同时, 对 Ag@AgBr 等离子体光催化剂可见光降解亚甲基蓝的催化机理进行了分析。

关键词: 银 溴化银 等离子体共振 光催化 可见光活性 亚甲基蓝

Abstract: Ag@AgBr plasmon photocatalyst was prepared by the deposition-precipitation and photo-reduction method. The synthesized samples were characterized by X-ray diffraction, scanning electron microscopy, and UV-Vis diffuse spectroscopy. The photocatalytic activity and stability of the prepared samples were evaluated by the degradation of methylene blue (MB) under the visible light ($\lambda > 420$ nm) irradiation. Several parameters, such as catalyst concentration, pH value, initial MB concentration, H₂O₂ content, recycling runs, and scavengers, were examined. The results show that the photocatalytic activity of Ag@AgBr reached 96% in MB aqueous solution (10 mg/L) containing 1 g/L catalyst at pH = 9.8 under visible-light irradiation, and it almost kept unchanged after five-cycle photocatalytic test. The degradation efficiency of MB had little variation in the presence of a small amount of H₂O₂ but reduced in the presence of excessive H₂O₂. MB photodegradation was greatly suppressed by ethylenediaminetetraacetic acid while slightly decreased by isopropanol. The photocatalytic mechanism for MB degradation by Ag@AgBr under visible light irradiation was also presented.

Keywords: silver, silver bromide, plasmon resonance, photocatalysis, visible-light activity, methylene blue
