摘要 以非离子型表面活性剂为模板剂, 采用蒸发诱导自组装法制备了一系列不同 WO_3 含量的有序介孔 $\text{WO}_3\text{-TiO}_2$ 复合材料, 并表征了其孔结构、形貌、孔隙率、光谱性质及组成。结果表明, 该材料呈二维六方 $p6mm$ 对称和锐钛矿晶相结构; 与无序 $\text{WO}_3\text{-TiO}_2$ 复合材料相比, 其比表面积更大 ($152\text{--}154 \text{ m}^2/\text{g}$), 孔径更均一 (5.3 nm), 且比纯 TiO_2 的带隙宽度更窄 (3.0 eV)。将该 $\text{WO}_3\text{-TiO}_2$ 样品用于可见光光催化降解水相中罗丹明 B 和 2,4-二氯苯氧乙酸的反应中, 发现 WO_3 含量适当的有序介孔 $\text{WO}_3\text{-TiO}_2$ 样品的光催化活性比无序的样品和纯 TiO_2 的更高。

关键词: 三氧化钨 二氧化钛 有序介孔材料 光催化 罗丹明 B 2,4-二氯苯氧乙酸

Abstract: A series of ordered mesoporous $\text{WO}_3\text{-TiO}_2$ composite materials with different WO_3 loadings were prepared by using a single step nonionic-surfactant-templating combined with evaporation-induced self-assembly (EISA) technique. The mesostructure, morphology, porosity, optical property, and composition of as-prepared materials were characterized. The characterization results confirmed that the ordered composite materials exhibited 2D hexagonal $p6mm$ symmetry and anatase phase structure with larger BET surface area ($152\text{--}154 \text{ m}^2/\text{g}$) and more uniform pore size (5.3 nm) compared with the disordered $\text{WO}_3\text{-TiO}_2$ composite material as well as narrow bandgap (3.0 eV) with respect to pure TiO_2 . Subsequently, the ordered mesoporous composite materials were successfully applied to the degradation of rhodamine B and 2,4-dichlorophenoxy acetic acid in the liquid phase under visible-light ($\lambda > 400 \text{ nm}$) irradiation, and enhanced photocatalytic activity compared with the disordered $\text{WO}_3\text{-TiO}_2$ composite material and pure TiO_2 was obtained for the samples with suitable WO_3 loadings.

Keywords: tungsten trioxide, titania, ordered mesoporous material, photocatalysis, rhodamine B, 2,4-dichlorophenoxy acetic acid
