摘要 以Cu(NO<sub>3</sub>)<sub>2</sub>·3H<sub>2</sub>O和P25为前躯体,通过简单浸渍法制备了CuO/TiO<sub>2</sub>光催化剂,利用N<sub>2</sub>物理吸附、XRD、TEM、UV-vis漫反射光谱分析了催化剂的结构特性。研究了Cu组分的负载量、催化剂在反应液中的分散量、催化剂焙烧温度、反应液中甲醇浓度对CuO/TiO<sub>2</sub>光催化反应产氢活性的影响,并考察了催化剂的稳定性,提出了该体系光催化反应的机理。结果表明,Cu的适宜负载量为2.0%~7.5%(质量分数),在Cu质量分数2.0%、催化剂焙烧温度350℃、甲醇的体积浓度为10%、催化剂分散量为1.0 g/L时,产氢活性可达到1 022 μmol/(h·g),并且该催化剂具有较好的稳定性。

关键词: TiO<sub>2</sub> CuO 光催化 氢气 可见光

Abstract: CuO/TiO<sub>2</sub> composites were prepared by a simple impregnated method with Cu(NO<sub>3</sub>)<sub>2</sub>·3H<sub>2</sub>O and P25 as precursors. The characteristic of photocatalysts were analyzed by N<sub>2</sub>-physisorption, XRD, TEM, UV-vis DRS spectra. In this paper, the effects of Cu content, the scattered catalyst amount, calcination temperature of the photocatalyst and methanol concentration for the photocatalytic activity of CuO/TiO<sub>2</sub> composites were studied. We also investigated the stability of the catalyst and proposed a mechanism of the photocatalytic process. The results suggested that the appropriate content of Cu component in CuO/TiO<sub>2</sub> is 2.0%~7.5% and hydrogen production rate can reach 1 022 μmol/(h·g) at 2.0% of Cu content, 10% of methanol concentration, 350℃ of calcination temperature and 1.0 g/L of scattered catalyst amount. It was also demonstrated that CuO/TiO<sub>2</sub> photocatalyst had a stable activity for H<sub>2</sub> evolution.

Key words: TiO<sub>2</sub> CuO photocatalyst hydrogen visible light
