## 摘要:

通过羧甲基壳聚糖接枝二甲基十八烷基环氧丙基氯化铵, 合成了水油两溶性的羧甲基壳聚糖十八烷基季铵盐(OACMC), 并用其代替合成磷脂与胆固醇反应, 制备阳离子高聚物脂质体(CPL). 利用阳离子高聚物脂质体包覆水溶性 $\text{Fe}_3\text{O}_4$ 磁流体, 构建磁性阳离子高聚物(MCPL)体系. 用TEM, DLS, VSM, FTIR及Zeta电位仪等对所制样品进行表征. 结果表明, 磁性阳离子高聚物脂质体在水相中可稳定存在, 粒径可达到15.3 nm, 分散性较好, Zeta电位可达到+38.22 mV, 比饱和磁化强度为27.9 A·m<sup>2</sup>/kg, 具有超顺磁性; MCPL对药物长春新碱的包封率可达到93.1%, 在Tris-HCl(pH=7.4)缓冲溶液中具有良好的缓控释功能.

## Abstract:

Octadecyl quaternized carboxymethyl chitosan(QACMC) was synthesized through carboxymethyl chitosan grafting with glycidyl octadecyl dimethylammonium chloride. Then, novel magnetic cationic polymeric liposomes(MCPL) formed from QACMC/cholesterol and  $\text{Fe}_3\text{O}_4$  ferrofluid were prepared via Thin-Layer Evaporation. The structure and properties of all samples were characterized via TEM, DLS, VSM and FTIR. The results show that the superparamagnetic cationic polymeric liposomes were prepared successfully. It was stable in aqueous phase and had a high zeta potential of +38.22 mV. The average diameter of MCPL was about 15 nm and the saturation magnetization value of it was 28 A·m<sup>2</sup>/kg at 300 K. Vincristine as a kind of hydrophilic components was entrapped into its aqueous core. Vincristine encapsulation efficiency of MCPL was 93.1% and it exhibited a slow steady release of vincristine over two weeks at 37 °C in Tris-HCl(pH=7.4).
