## **Modelling the ca thin-layer drying semi-industrial continuous ban**

Czech J. Food Sci., 29 (2011)

This paper presents a mathe  
modelling of the drying proce  
industrial continuous band d  
slices with the thickness of 5  
used for the drying experime  
experiments were conductec  
temperatures, 50, 60, and 70  
air velocities, 0.5, 1.0, and 1  
three chain linear velocities,  
4,  $2.78 \times 10^{-4}$ , and  $3.33 \times 10^{-4}$   
with three replications for ea  
The Lewis, Henderson & Pal  
models were fitted to the exp  
data of the moisture ratio aga  
sample position using non-li  
regression analysis by MATL  
computer program. The mod  
compared based on their coe

determination ( $R^2$ ), root mean square errors (RMSE), and reduced chi-square ( $\chi^2$ ) between the experimental and predicted moisture ratios. Consequently, the Page model was selected as the best mathematical model for describing the drying kinetics of the carrot slices. The parameters  $k$  and  $m$  with the variables  $T_a$  and  $T_s$  were determined. The effective diffusivity varied from  $3.21 \times 10^{-7}$  to  $8.98 \times 10^{-7}$  m<sup>2</sup>/s. The energy of activation varied from 23.02 to 28.1 kJ/mol using Arrhenius equation.

### **Keywords:**

carrot; thin-layer drying; mathematical modelling; semi-industrial-convection band dryer; effective moisture ratio
