摘要 采用52对核心引物对7个棉花常规种进行了SSR分析。结果显示: 每个品种的24个受检单粒棉种中, 杂粒数最多为9个, 最少1个, 平均为3.9个; DNA位点纯合率最高为100%, 最低92.3%, 平均为97.0%。研究表明, 品种纯度与DNA位点纯合率呈高度正相关。采用SSR标记进行分子检测, 能准确区分因遗传因素与生产加工对品种纯度造成的影响。

关键词: 棉花常规种 SSR标记 纯度 位点纯合率

Abstract: In an SSR study of seven conventional cotton cultivars, we analyzed 24 seeds of each cultivar using 52 core primer pairs. Among the seven cultivars, the number of miscellaneous seeds ranged from 1 to 9, and averaged 3.9. The percentage of homozygous DNA loci varied from 92.3% to 100%, and averaged 97.0%. Our analysis revealed that varietal purity and DNA locus homozygosity levels were highly positively correlated. Using SSR molecular markers, we were able to accurately differentiate between the impacts of genetic factors and seed production procedures on cultivar purity.

Keywords: conventional cotton SSR marker purity homozygous DNA locus
