#### 摘要:

应用透射电镜技术探求甜菜单体附加系M14 (*Beta vulgaris* L., VV+1C, 2n=18+1)有性生殖大孢子与二倍体孢子生殖大孢子发生时的超微结构特征, 了解有性生殖和无融合生殖起始细胞的超微结构差别。甜菜单体附加系M14 为兼性无融合生殖体, 大孢子发生有韭型、蝶须型和蓼型三种类型。韭型和蓼型大孢子发生时均起源于大孢子母细胞, 二分体之前从形态结构上难以区分; 减数分裂前期I, 细胞核中出现核液泡, 形成联会复合体, 细胞质改组, 细胞壁上沉积胼胝质。韭型大孢子发生时, 只进行减数第一次分裂, 不发生减数第二次分裂, 形成二分体, 珠孔端二分体细胞退化, 合点端二分体细胞发育为二倍体功能大孢子。蓼型二分体的珠孔端细胞在减数第二次分裂前或分裂过程中退化, 合点端细胞经减数第二次分裂形成两个细胞, 构成三分体, 最终合点端大孢子发育为单倍体功能大孢子。蝶须型大孢子发生是M14 中唯一的二倍体孢子无融合生殖方式, 其大孢子发生时大孢子母细胞不发生减数分裂, 不出现核液泡, 未形成联会复合体, 无细胞质改组, 细胞壁上缺乏胼胝质的沉积和缺乏胞间连丝, 这些可作为二倍体孢子无融合生殖的鉴定指标。

#### Abstract:

Research on ultrastructure of megasporogenesis facultative apomictic monosomic addition line M14 of *Beta corolliflora* of sugar beet by TEM, in order to get the distinctions between the initial cells of sexual reproduction and apomixes. The embryo-sac development of M14 can be classified into three types: *Allium odorum*-type, *Antennaria*-type, and *Polygonum*-type. There was little difference between *Allium odorum*-type and *Polygonum*-type until the stage of dyads. At meiosis I, nuclear vacuoles, synaptonemal complexes showed up, cytoplasmic components underwent differentiation, callose deposited in the wall. The megasporocyte of *Allium odorum*-type only underwent meiosis I to form a dyad, and then the micropylar dyad cell of *Allium odorum*-type degenerated quickly, while the chalazal one developed into diploid functional megaspore. In *Polygonum*-type the micropylar dyad cell degenerated quickly, while the chalazal one finished meiosis II to form two unequal-sized megaspore. The megaspore at chalazal end developed into haploid functional megaspore. *Antennaria*-type was the only fashion of apomictic recreation of M14. Ultrastructure observation on M14 showed the signs of diploid apomictic recreation: no meiosis, no nuclear vacuoles, no cytoplasmic components differentiation, no callose deposition, and no plasmodesmata.

Keywords: Monosomic addition line in sugar beet Facultative apomixes Megasporogenesis *Allium odorum*-type *Antennaria*-type *Polygonum*-type Ultrastructure
