摘要 采用光呼吸抑制剂NaHSO<sub>3</sub>抑制光呼吸后, 测定了姜叶片光合作用相关参数、叶绿素荧光参数、米勒反应及氮代谢关键酶活性等的变化。结果表明, NaHSO<sub>3</sub>处理姜叶片1 d后, 净光合速率较对照上升了19%, 但随后呈现出下降趋势, 至处理后6 d时比对照降低了17%, 同时伴随着G<sub>s</sub>及C<sub>i</sub>的降低, NaHSO<sub>3</sub>处理显著降低了F<sub>v</sub>/F<sub>m</sub>、Φ<sub>PSII</sub>、q<sub>p</sub>, 提高了NPO, 增强了米勒反应, 增加了过氧化氢含量, 降低了硝酸还原酶、谷氨酰胺合成酶和谷氨酰胺合酶活性, 表明NaHSO<sub>3</sub>抑制姜叶片光呼吸的同时, 也显著抑制了碳氮代谢。

关键词: 姜 光呼吸 光能耗散 氮代谢

Abstract: Gas exchange, chlorophyll fluorescence, the Mehler reaction, and activities of nitrate reductase, glutamine synthetase, and glutamate synthase were measured after addition of the photorespiration inhibitor NaHSO<sub>3</sub> in ginger leaves. According to our results, after 1 day of NaHSO<sub>3</sub> treatment, the net photosynthetic rate increased by 19% compared with the control. The rate subsequently decreased and was reduced by 17% compared with the control on day 6. Meanwhile, stomatal conductance and the intercellular CO<sub>2</sub> concentration decreased. NaHSO<sub>3</sub> treatment significantly decreased the F<sub>v</sub>/F<sub>m</sub>, Φ<sub>PSII</sub>, q<sub>p</sub>, and activities of nitrate reductase, glutamine synthetase and glutamate synthase, and increased NPO, the Mehler reaction, and H<sub>2</sub>O<sub>2</sub> concentration. These results show that carbon and nitrogen metabolism is reduced when NaHSO<sub>3</sub> inhibits photorespiration in ginger leaves.

Keywords: ginger, photorespiration, light energy allocation, nitrogen metabolism
