摘要 为了研究‘地平线’天竺葵的花芽分化特性及光周期对其生长发育的影响,采用石蜡切片方法观察了花芽分化的过程,探讨了7种光周期处理对始花期及开花质量的影响。结果表明: (1) ‘地平线’的花芽分化过程可以划分为8个时期,持续时间大约为9周; (2) ‘地平线’花芽分化时期与各生长指标(株高、株幅、真叶数和播种周数)均极显著相关,通过回归方程判断其幼龄期在5片真叶前结束; (3) ‘地平线’为量性短日照植物,促其早花的最佳光周期为昼12 h/夜12 h; (4) 较长日照下‘地平线’的株形高大松散,较短光周期下矮小紧凑。‘地平线’天竺葵在5片真叶前,采用16 h 日照栽培,可得到健壮幼苗;5叶期后,12 h 日照诱导,可促进分枝开花。

关键词: 天竺葵 花芽分化 营养生长 光周期 开花调节

**Abstract:** To study the characteristics of floral bud differentiation (FBD) and effects of photoperiod on growth and development of *Pelargonium hortorum* ‘Horizon’, paraffin section method was used in identify the process of FBD, and flowering time and flower quality were investigated as the effects of 7 kinds of photoperiod. The results show that: (1) There were 8 phases during FBD of ‘Horizon’, and it lasted about 9 weeks. (2) Significant correlation existed between vegetative growth and FBD phases, and juvenile phase of ‘Horizon’ ended at 5-leaf stage according to the regression equations. (3) ‘Horizon’ was a facultative short day plant, of which the best photoperiod promoting flowering was 12 h. (4) The plants tended to have a tall and loose habit under longer days, and an opposite habit under shorter days. It is suggested that *Pelargonium hortorum* ‘Horizon’ planted under long-day of 16 h before 5-leaf stage to be strong as seedlings, and then under short-day of 12 h to promote branches and flowers.

**Keywords:** *Pelargonium hortorum*, floral bud differentiation, vegetative growth, photoperiod, flower control
