Identification of SNPs in *ME1* gene and association analysis with meat quality traits in Chinese Red cattle

Zhou G.L., Cao Y., Jin H.G.:

Czech J. Anim. Sci., 59 (2014): 297-301

[ [Supplementary material](#) ]

[ [fulltext](#) ]

The objective of this study was to identify single nucleotide polymorphisms (SNPs) in coding regions of bovine *ME1* gene

and to evaluate if the polymorphisms are associated with meat quality traits in Chinese Red cattle. Four SNPs were identified:  
NW\_001495544:g.1721768G>A in exon 2, g.1653796T>A in exon 4, g.1649532G>A in exon 5, and g.1546272T>C in exon 12 and they were genotyped by applying the PCR-RFLP method. Statistical analysis showed that two SNPs, g.1649532G>A and g.1546272T>C, were significantly associated with cooking loss and pH<sub>24h</sub> ( $P < 0.05$ ). But no statistically significant differences were observed in the g.1721768G>A and g.1653796A>T SNPs for meat quality traits tested in Chinese Red cattle. This suggests that *ME1* gene is a candidate that may have effects on meat quality traits in cattle.

**Keywords:**

candidate gene; polymorphism; beef; Chinese Red cattle
