摘要

应用PCR和Genome Walking技术克隆获得长度为168 bp的草鱼(*Ctenopharyngodon idellus*) α -淀粉酶基因外显子I序列和2063 bp的5'侧翼序列。将草鱼 α -淀粉酶基因外显子I序列与已知几种鱼类 α -淀粉酶基因外显子I序列比对,相似度为68%~86%。将草鱼 α -淀粉酶基因5'侧翼序列进行生物信息学分析,确定了其转录起始区域及转录起始位点(TSS);在TSS上游30 bp处有1个TATA-box,-58 bp处有CCAAT-box;在5'侧翼序列中还发现有GATA-1、OCT-1、GR、HNF-3、AP1和SP1等转录因子结合位点。草鱼 α -淀粉酶基因5'侧翼序列的克隆,为进一步研究不同食性鱼类 α -淀粉酶基因侧翼序列的差异、鱼类 α -淀粉酶基因的表达、功能及调控机理奠定基础。

关键词 : 草鱼, α -淀粉酶基因, Genome Walking, 5'侧翼序

Abstract :

PCR and Genome Walking methods were applied to obtain a 168 bp α -amylase gene exon I sequence and a 2 063 bp α -amylase gene 5' flanking sequence from grass carp (*Ctenopharyngodon idellus*). The sequence alignment of α -amylase gene exon I between grass carp and other fishes showed that the similarity was 68%~86%. The sequence analysis of α -amylase gene 5' flanking sequence of grass carp confirmed a transcription initiation region and a transcriptional start site (TSS). There were a TATA-box at 30 bp and a CAAT-box at -58 bp. There were some transcriptional factor binding sites in the α -amylase gene 5' flanking sequence, such as GATA-1, OCT-1, GR, HNF-3, AP1 and SP1. The α -amylase gene 5' flanking sequence of grass carp was cloned successfully, which provides references for studies on differences of α -amylase gene 5' flanking sequence among different feeding fishes, as well as on the expression, function and regulation mechanism of α -amylase gene in fishes.

Key words : *Ctenopharyngodon idellus* α -amylase gene Genome Walking 5' flanking sequence
