中文摘要:目的:观察人参皂苷Rg₁诱导人神经干细胞(neural stem cells of human,hNSCs)的功能表达。方法:采用全细胞膜片钳技术分析人参皂苷Rg₁诱导hNSCs分化7 d时,神经元样细胞的膜电生理特性以及钠、钾离子通道的功能表达。结果:人参皂苷Rg₁(20 mg·L⁻¹)诱导hNSCs分化7 d时,神经元样细胞的膜静息电位为(-45.70±2.63) mV,膜电容为(26.89±1.91) pF,膜输入阻抗为(877.51±20.4) MΩ与对照组相比均P<0.05;电压依赖性的快速激活、快速失活的内向Na⁺电流,检出率50%,平均峰值为(711.48±158.03) pA(与对照组相比P>0.05);外向K⁺电流的主要成分是快速激活快速失活的瞬时外向K⁺电流和延迟整流外向K⁺电流,其平均峰值为(1 070.42±177.18) pA(与对照组相比P>0.05)。结论:人参皂苷Rg₁可以促进hNSCs功能表达和成熟。

中文关键词:人参皂苷Rg₁ 人神经干细胞 功能表达 膜片钳

Effect of ginsenoside Rg₁ on functional expression of human neural stem cells:a patch clamp study

Abstract/Objective:To observe the effects of ginsenoside Rg₁ on the functional expression of human neural stem cells (hNSCs).

Method:The membrane electrophysiological properties and sodium and potassium ion channels in the hNSCs induced by Rg₁ were analyzed using the whole-cell patch-clamp. **Result:**On the 7th day, the neuron-like cells derived from ginsenoside Rg₁(20 mg·L⁻¹)-induced NSCs show:① The resting membrane potential:(-45.70±2.63) mV, the membrane capacitance: (26.89±1.91) pF, the membrane input impedance:(877.51±20.4) MΩ (P<0.05 compared with the control group, respectively); ② The detection rate of inward sodium current which is rapidly activated and inactivated in voltage-dependence was 50%, and its average peak value was (711.48±158.03) pA (P>0.05 compared with the control group); ③The outward potassium currents were composed of rapidly activated and inactivated transient outward potassium current and delayed rectifier outward potassium current, and its average peak value was (1 070.42±177.18) pA(P<0.05 compared with the control group). **Conclusion:**Ginsenoside Rg₁ can promote the functional expression and maturity of hNSCs.

Keywords: ginsenoside Rg₁ human neural stem cell functional expression patch clamp
