EVALUATION OF 912 PERSONS FOR A.S.O.

A Bollourian, K. Yazdani, M. Horriat

Abstract:

Nine hundred and twelve, consecutive patients attended various clinics of Isfahan University for various complains have been evaluated for A.S.O. Titers among whom 172 has positive nasopharyngeal cultures for type A, B hemolytic streptococcus. All of the patients with positive cultures have A.S.O. Titers of above 333 Todd's unit, while with exception of 22 cases all of the others had values of less than 333. All of the patients, with positive cultures were in their second or third decades of life. According GO these findings we suggest that A.S.O. values of more than 333 Todd units should be accepted as an important finding favoring streptococca1 infection.
