摘要:

**摘要目的:** 观察不同压力高压氧预处理(HBO-PC)对大鼠脑缺血再灌注后缺血半暗带神经细胞凋亡的影响。方法: 将48只Wistar大鼠随机分为3组: 假手术组(n=8); 对照组: 大脑中动脉闭塞(MCAO)模型组(n=8); 实验组: HBO-PC+MCAO组(n=32)。实验组再按不同的HBO-PC压力分为1.5 ATA(0.15MPa)、2.0ATA (0.20MPa)、2.5ATA (0.25MPa)和3.0ATA (0.30MPa) 4个亚组, 每组8只。按不同治疗压力, 每次吸氧1h、隔天1次、共5次, 10d完成。最后一次HBO-PC 24h后, 根据Zea-Longa线栓法制作MCAO再灌注损伤模型, 缺血2h再灌注24h后用免疫组织化学法和原位末端脱氧核糖转移酶标记(TUNEL)法检测脑缺血半暗带神经细胞凋亡情况。假手术组和对照组不进行HBO或常压氧治疗, 10d后处理同实验组。结果: 实验组动物行为改善, 脑梗死灶缩小, 脑缺血半暗带凋亡细胞数和半胱天冬蛋白酶-3(caspase-3)阳性细胞数不同程度降低, B细胞淋巴瘤/白血病-2(Bcl-2)表达不同水平增高, 与对照组比较差异均有显著性意义( $P<0.05$ ); 而2.0ATA和2.5ATA压力条件相比较1.5ATA和3.0ATA上述凋亡指标差异亦有显著性( $P<0.05$ ); 但2.0 ATA和2.5 ATA间, 1.5ATA和3.0ATA间差异均无显著性意义( $P>0.05$ )。结论: 通过下调缺血半暗带神经元线粒体途径的凋亡水平, HBO-PC可以减轻大鼠脑缺血再灌注损伤, 组内比较2.0ATA和2.5 ATA下HBO-PC优于1.5 ATA和3.0 ATA。

Fund Project:

Abstract:

**Absract Objective:** To study the influences of different atmosphere absolute (ATA) hyperbaric oxygen preconditioning (HBO-PC) on the neuroprotective and apoptosis related protein/gene expressions of caspase-3 and Bcl-2 in rats with cerebral ischemia-reperfusion injury. Method: Totally 48 Wistar rats were randomly assigned to the following three groups: sham group (n=8), control group(MCAO group, n = 8), and trial group (HBO-PC plus MCAO group,n=32). The rats in trial group were subdivided into, 1.5ATA (0.15MPa) subgroup, 2.0ATA (0.2 MPa) subgroup, 2.5ATA (0.25MPa) subgroup, and 3.0ATA(0.3MPa) sub group, with 8 rats in each group. HBO-BC was administered by using 100% oxygen at different ATA for 60min at 24h interval for 5 times in 10d. The last HBO-PC was performed at 24h before middle cerebral artery occlusion(MCAO) produced by Zea-Longa filament method with some modifications. The samples of each group underwent immunohistochemistry staining and TUNEL reaction to observe the expressions of cysteine-asparate protease-3(caspase-3) and B cell lymphoma/leucemia gene(Bcl-2) and apoptosis of neurons in ischemia penumbra. Result: After HBO-PC with 1.5ATA、2.0ATA、2.5ATA and 3.0ATA all rat's infarction volume decreased, neurological behavior improved, meanwhile caspase-3 activity decreased, expression of Bcl-2 upregulated, and apoptosis of ischemic penumbra tissue abated. In all trial sub groups, above indexes showed significant difference as compared with that in control group( $P<0.05$ ), however, the effects of HBO-PC with 2.0ATA and 2.5ATA were superior to that 1.5ATA and 3.0ATA ( $P<0.05$ ). Conclusion: HBO-PC protects brain tissues from ischemia-reperfusion injury by suppressing mitochondrial apoptotic pathways. The effects of HBO-PC with 2.0ATA and 2.5ATA were superior to that with 1.5ATA and 3.0ATA.
