摘要

目的 探讨右美托咪定(DMM)对氯胺酮(Ket)镇痛及催眠作用的影响。**方法** 采用热板法观察DMM 10 $\mu\text{g} \cdot \text{kg}^{-1}$ 对Ket 25 $\text{mg} \cdot \text{kg}^{-1}$ 热板痛阈(HPPT), 扭体法观察DMM 5 $\mu\text{g} \cdot \text{kg}^{-1}$ 对Ket 25 $\text{mg} \cdot \text{kg}^{-1}$ 扭体次数的影响; 翻正反射法观察DMM 40 $\mu\text{g} \cdot \text{kg}^{-1}$ 对Ket 100 $\text{mg} \cdot \text{kg}^{-1}$ 翻正反射消失持续时间的影响。**结果** 热板法实验中, 与正常对照组相比, 单独给DMM在5~15 min HPPT明显延长($P < 0.05$, $P < 0.01$), Ket麻醉组在5 min HPPT明显延长($P < 0.01$)。与Ket麻醉组相比, 合用DMM组, HPPT增加更明显($P < 0.05$, $P < 0.01$)。与DMM+Ket合用组相比, DMM+阿替美唑(Ati)+Ket合用组HPPT明显降低($P < 0.05$, $P < 0.01$), 且与Ket麻醉组相当, 10 min后与正常对照组接近。扭体法实验中, 与正常对照组相比, 单用DMM组及Ket麻醉组的扭体次数明显减少($P < 0.01$); 两者合用后, 扭体次数减少更明显, 与Ket麻醉组相比有显著差异($P < 0.01$)。与DMM+Ket组相比, DMM+Ati+Ket组的扭体次数明显增加($P < 0.01$), 且与单用DMM组和Ket麻醉组相当, 但依旧明显低于正常对照组($P < 0.01$)。翻正反射法实验中, 与Ket麻醉组相比, DMM+Ket合用组的翻正反射消失持续时间明显延长($P < 0.01$)。与DMM+Ket合用组相比, DMM+Ati+Ket合用组的翻正反射消失持续时间明显缩短($P < 0.01$), 且与Ket麻醉组接近。**结论** 合用右美托咪定, 氯胺酮的镇痛及催眠作用增强, 而 α_2 受体可能是该效应的主要受体机制之一。

Abstract

OBJECTIVE To explore effects of dexmedetomidine(DMM) on analgesic and hypnotic effects of ketamine(Ket).
METHODS Effect of DMM 10 $\mu\text{g} \cdot \text{kg}^{-1}$ on hot plate pain threshold (HPPT) of Ket 25 $\text{mg} \cdot \text{kg}^{-1}$ was detected by hot-plate test. Effect of DMM 5 $\mu\text{g} \cdot \text{kg}^{-1}$ on writhing times of Ket 25 $\text{mg} \cdot \text{kg}^{-1}$ was detected by writhing test and effect of DMM 40 $\mu\text{g} \cdot \text{kg}^{-1}$ on the duration of righting reflex disappearance of Ket 100 $\text{mg} \cdot \text{kg}^{-1}$ was detected by hypnotic test.
RESULTS In hot-plate test, compared with normal control group, HPPT was significantly prolonged within 5-15 min when given DMM alone($P < 0.05$, $P < 0.01$), and HPPT was significantly prolonged at 5 min when given Ket alone ($P < 0.01$). Compared with Ket group, HPPT significantly increased in DMM+Ket group($P < 0.05$, $P < 0.01$). Compared with DMM+Ket group, HPPT significantly decreased in DMM+atipamezole(Ati)+Ket group ($P < 0.05$, $P < 0.01$) and was similar with Ket group. In writhing test, compared with normal control group, writhing times significantly decreased in DMM group and Ket group($P < 0.01$), and the writhing times more significantly decreased in Ket+DMM group ($P < 0.01$). Compared with DMM+Ket group, the writhing times increased significantly in DMM+Ati+Ket group ($P < 0.01$) and was similar with DMM group or Ket group, but it still was lower than normal control group ($P < 0.01$). In hypnotic test, compared with Ket group, the duration of righting reflex disappearance was significantly prolonged ($P < 0.01$) in DMM+Ket group. Compared with DMM+Ket group, the duration of righting reflex disappearance was significantly shortened ($P < 0.01$) and was similar with Ket group in DMM+Ati+Ket group.
CONCLUSION The analgesic and hypnotic effects of Ket are enhanced combined with DMM, and the alpha 2 receptor may be one of the major receptors in their mechanisms.
