News From the Field

UC research tests range of electrical frequencies that help heal chronic wounds

March 3, 2014

Hard-to-heal wounds, like diabetic ulcers, fester because of insufficient blood supply at the wound site. However, the application of an electrical stimulus can promote the growth of blood vessels, and new University of Cincinnati (UC) research examines the best stimulus parameters--such as frequency and magnitude--for successful therapy. [Full Story](#)

Source

University of Cincinnati

The National Science Foundation (NSF) is an independent federal agency that supports fundamental research and education across all fields of science and engineering. In fiscal year (FY) 2014, its budget is \$7.2 billion. NSF funds reach all 50 states through grants to nearly 2,000 college universities and other institutions. Each year, NSF receives about 50,000 competitive requests for funding, and makes about 11,500 new funding awards. NSF also awards about \$593 million in professional and service contracts yearly.
