通过以往试验结果归纳(拟合)出经验公式

滚动阻力系数的影响因素

1. 速度 u_a 对 f 的影响

Effect of velocity u_a on resistance coefficient f .

$$u_a < 100\text{km/h} \Rightarrow f \approx \text{const.}$$

$$u_a > 200\text{km/h} \Rightarrow f \uparrow\uparrow$$

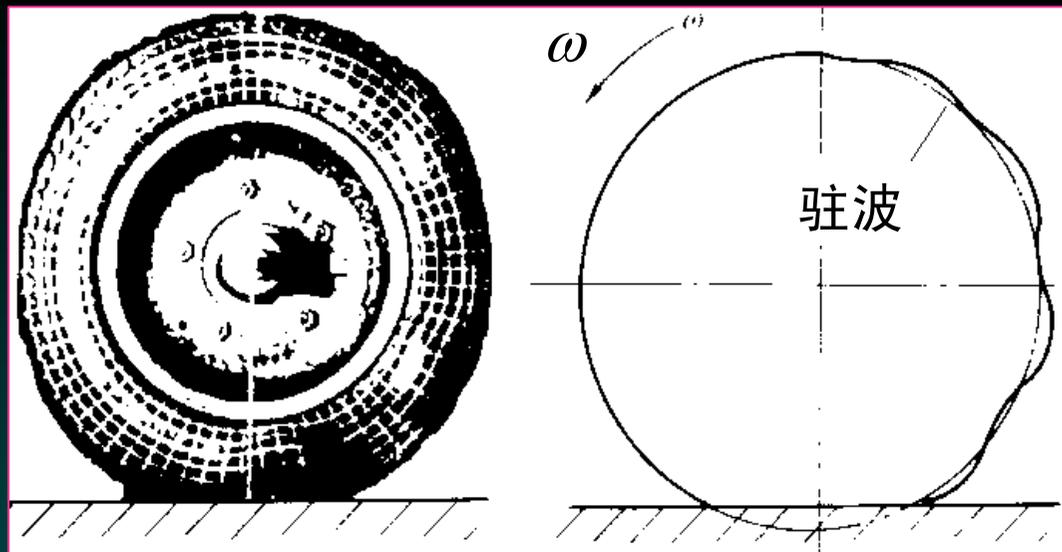

产生驻波现象，高温、脱落和爆裂。

creating a phenomenon of standing wave, heat, shed off, and burst.

驻波

Standing waves

弹性轮胎在滚动时,胎面各部分反复处于受力变形和恢复原形的过程。其中,使轮胎变形恢复到原状的力有弹力、胎压和离心力等。轮胎从接地受力变形,到离开地面后恢复原状,存在滞后时间。其长短与轮胎负荷、转速、工作温度和环境温度等有关。

负荷大或胎压过低,胎面变形大;转速高,胎面离心力大,使胎面反向变形。这样胎面就在正、反方向力的交替作用下造成胎面不同部位半径的波动。当轮胎行驶速度超过轮胎的挠屈变形极限速度后,胎面波动看上去变形移动的状态恰似停止,称作驻波。驻波常发生在胎肩与胎侧交界区。

2. 轮胎结构、材料、帘线对 f 的影响很大。子午线轮胎 f 小，天然橡胶 f 低，钢丝胎 f 低。

The tire structure, material, the influence of the lines upon the f is also very big. The meridian tire f is small, the crude rubber f is low.

3. 使用因素对滚动阻力影响也较大

$$P_a \uparrow \Rightarrow f \downarrow$$

但 $P_a \uparrow$ 道路受力 $\uparrow \Rightarrow$ 道路寿命 \downarrow

$$P_a \uparrow \Rightarrow \text{参与变形} \downarrow \Rightarrow f \downarrow$$

$$W \uparrow \Rightarrow f \uparrow (\text{稍微})$$

$$\delta = 1 + \frac{I_f}{mr^2} i_0^2 i_g^2 \eta_T + \frac{\Sigma I_w}{mr^2}$$

$$F_t = m \frac{du}{dt} + \frac{1}{r^2} \left(\sum I_w + I_f i_0^2 i_g^2 \eta_T \right) \frac{du}{dt} + F_f + F_w$$

$$= \delta m \frac{du}{dt} + F_f + F_w$$

$$\delta = 1 + \frac{1}{mr^2} \sum I_w + \frac{1}{mr^2} I_f i_0^2 i_g^2 \eta_T$$

$$F_t = \delta m \frac{du}{dt} + F_w + F_f$$

$$\delta_1 = \frac{1}{mr^2} \sum I_w$$

$$\delta_2 = \frac{1}{mr^2} I_f i_g^2 i_0^2 \eta_T$$

$$\delta = 1 + \delta_1 + \delta_2 i_g^2$$

$$\delta = 1.03 + 0.03 i_g^2$$

$$\delta_1 \approx 0.03$$

$$\delta_2 \approx 0.03$$

汽车行驶方程式__总结

- ☆ 只是表示各个物理量之间的数量关系。
- ☆ 有些项并不是外力。 F_t 不是作用于车轮上的切向反作用力，仅为了计算方便才定义为驱动力。
- ☆ 滚动阻力也不是作用于汽车上的阻力，而是以滚动阻力偶矩的形式作用于车轮上。
- ☆ 作用在汽车上的平移惯性力是 mdu/dt ，而不是 $m \delta du/dt$ 。飞轮惯性力矩作用在汽车的横截面上，而不作用于车轮上。
- ☆ F_j 代表惯性力和惯性力矩的总效应。
