

Last Class

- What is a database and a database system
- Why use a database
 - Data independence

Data Independence

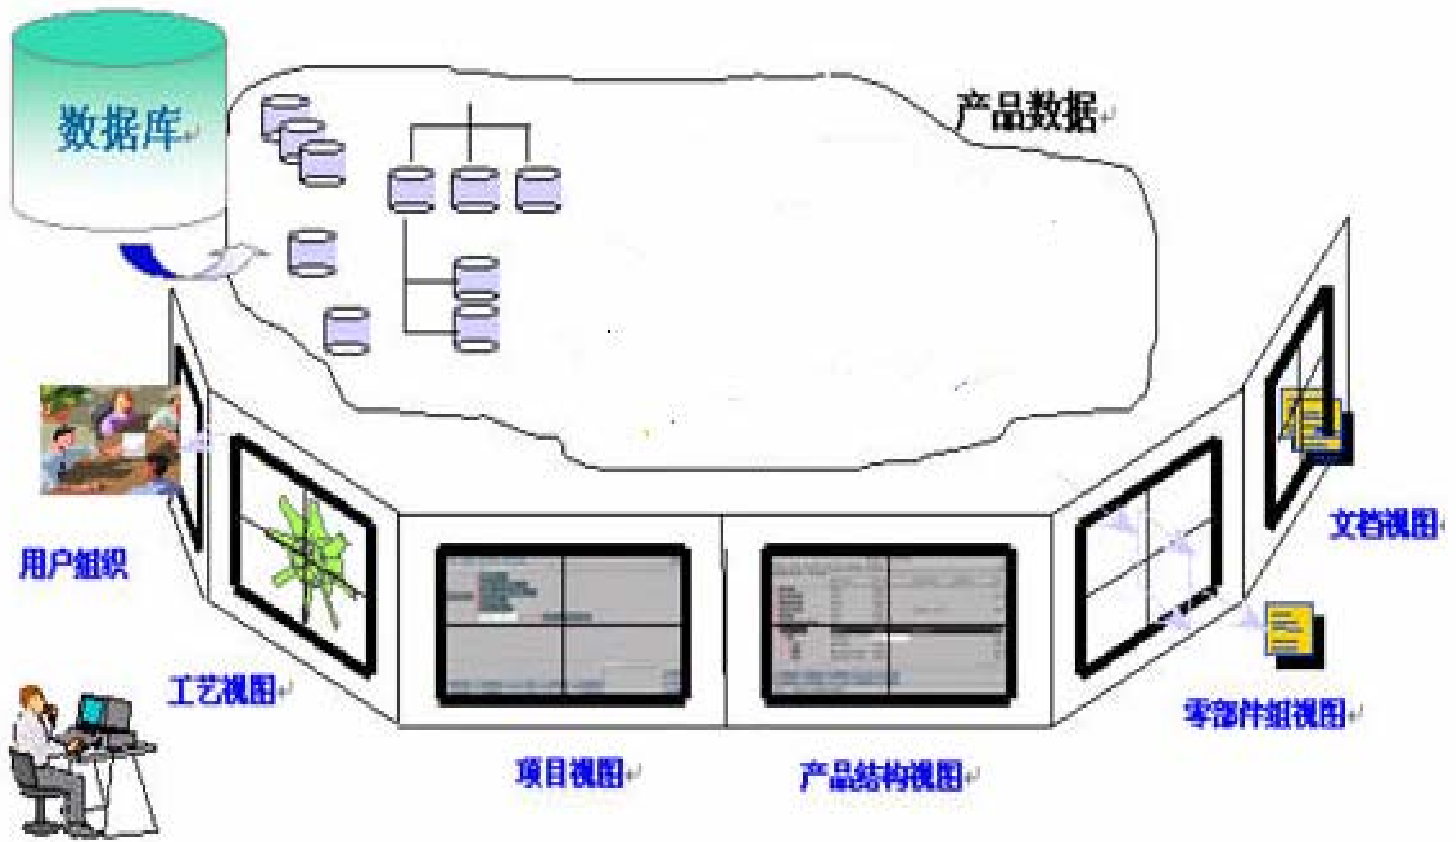

- Immunity of applications to change in physical representations and access technique
- major objective for database systems
- Two type data independence
 - Physical data independence
 - Logical data independence

Data Independence - Cont.

- Data dependent
data physical representation and access techniques are built into the application code (eg. File system)

Data Independence - Cont.

- database system need data independence
 - different application will requires different view of the same data
 - DBA must have the freedom to change the physical representation or access technique in response to modify existing applications

Data Independence - Cont.

- Data physical representation
 - Stored field - smallest unit of stored data
 - Stored record - collection of related stored field
 - Stored file - collection of all currently existing occurrences of one type of stored record
- Type with Occurrence (or instance)

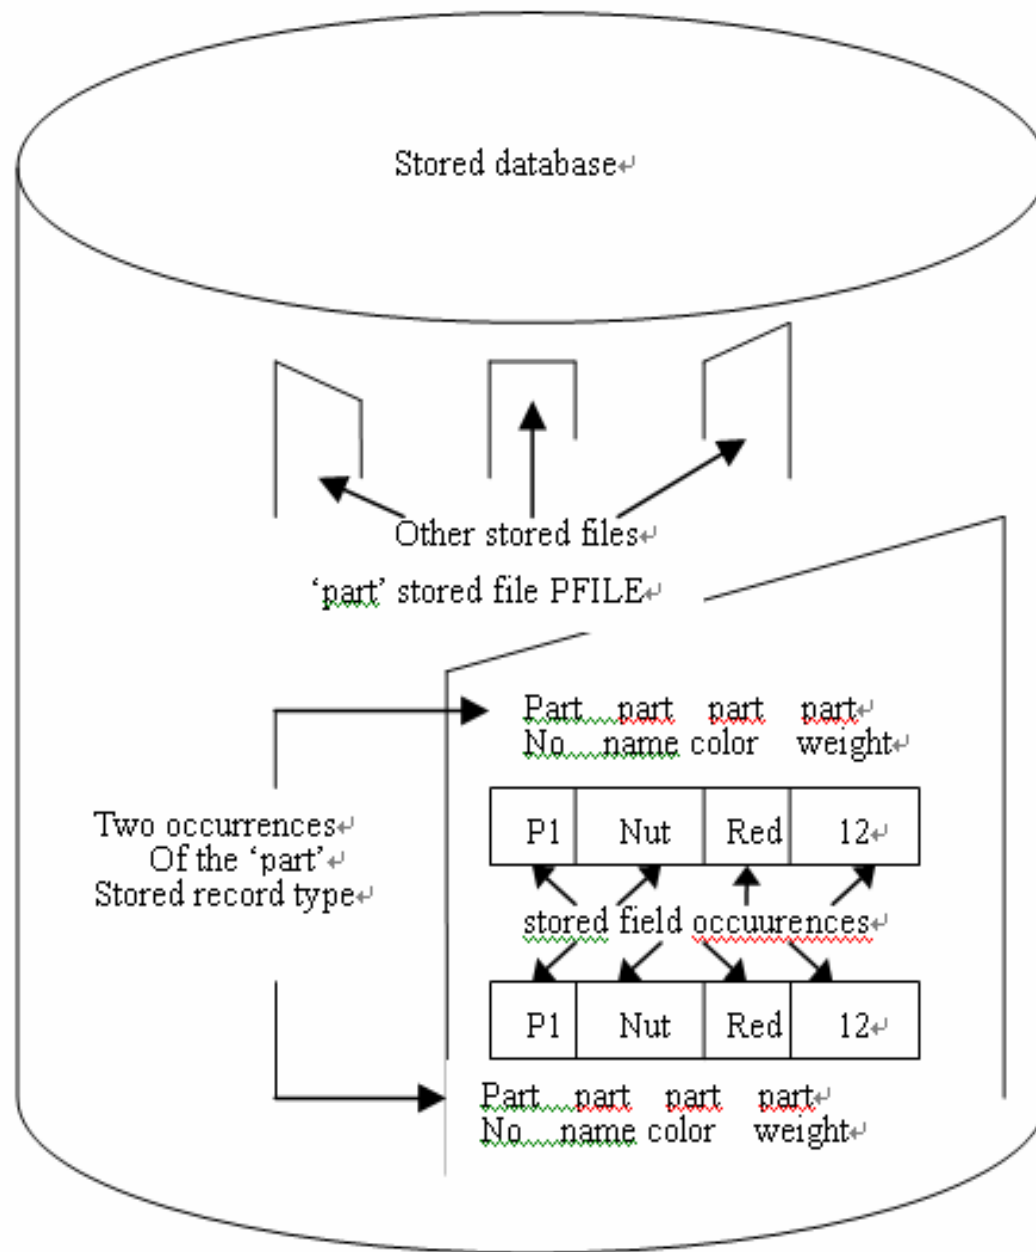

Fig 1.7 Stored fields, records, and files

Data Independence - Cont.

- List of the stored representation that might be subject to change
 - representation of numeric data
 - representation of character data
 - unit for numerical data
 - data coding
 - data materialization (direct / indirect)
 - structure of stored record
 - structure of stored files

Data Base Systems

- **Hierarchical system (1960s)**
 - C.W. Bachman IDS (Integrated Data Store)
 - data represent to is the form of tree structure
 - operator traversing pointers
 - data shared by several applications
- **Network System (1970s)**
 - CODASYL DBTG Report
 - data represent to user is graph structure
 - operator similar to hierarchical system

Data Base Systems-cont.

- **Relational system (1980s)**
 - Introduced in 1969-1970
 - data representation are table
 - operator generate new tables from old tables
 - Products : DB2, Ingres, Informix, SQL server, Oracle, Sybase, etc.
- **Tunning Prize**
 - Bachman (network DB) in 1973
 - E.F.Codd (Relational DB) in 1981
 - Jim Gray (Transaction) in 1998

Three Tunning Prize Person

C.W. Bachman

E.F. Codd

Jim Gray

Data Base Systems-cont.

- Object system
 - GemStone / Vansant ODBMS
 - Object relational system
- Multi-dimensional Approach
- Logical-based Approach
- XML Approach

Chapter2

Architecture

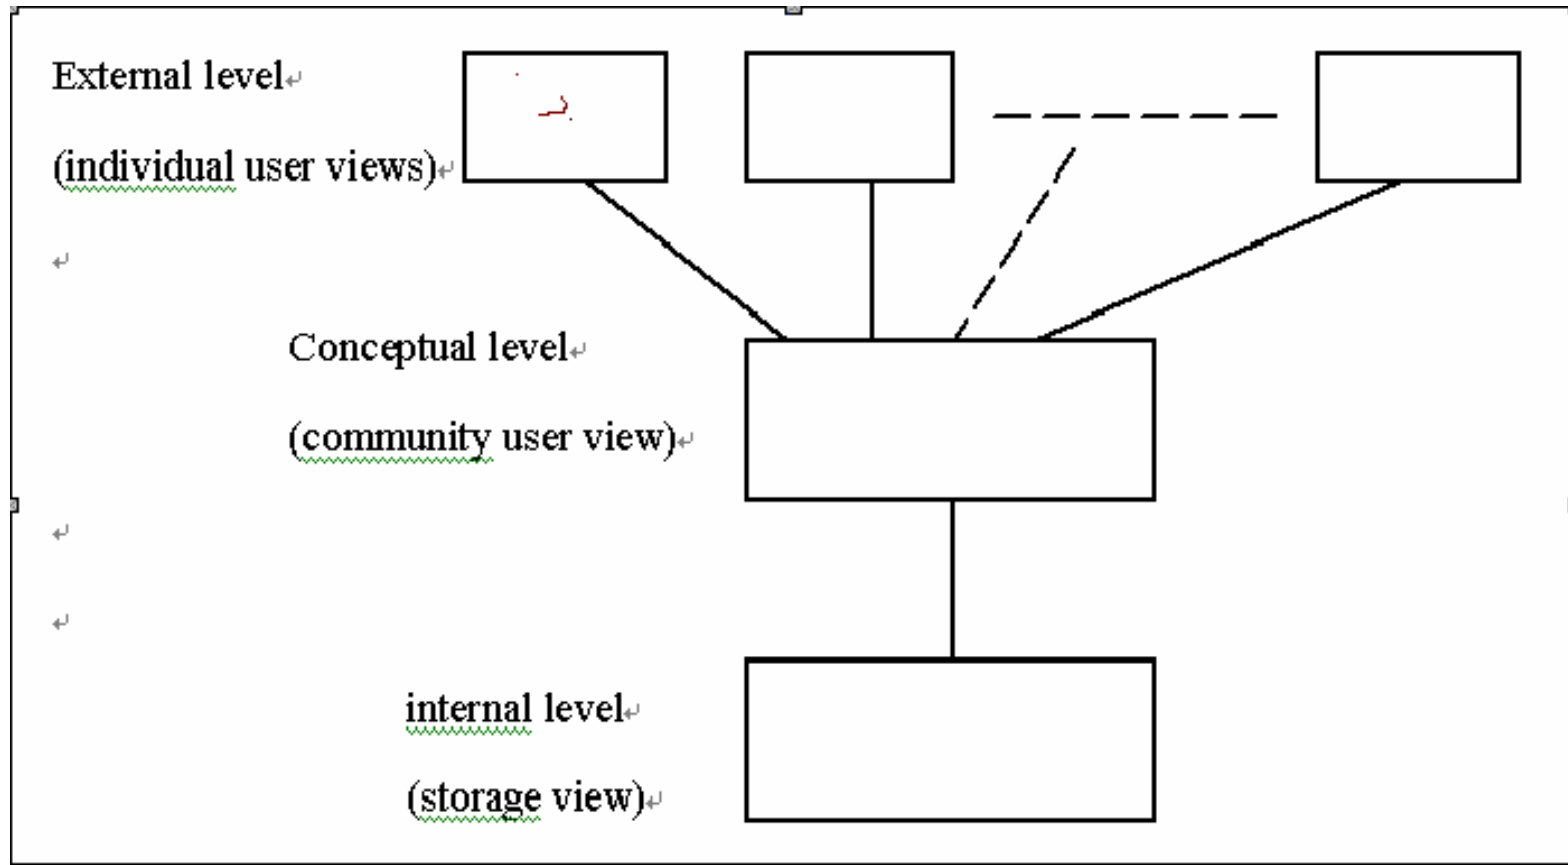

Contents

- Introduction
- The three level of the architecture
- DBA
- DBMS
- C/S architecture
- Utilities
- Data Access processing

Introduction

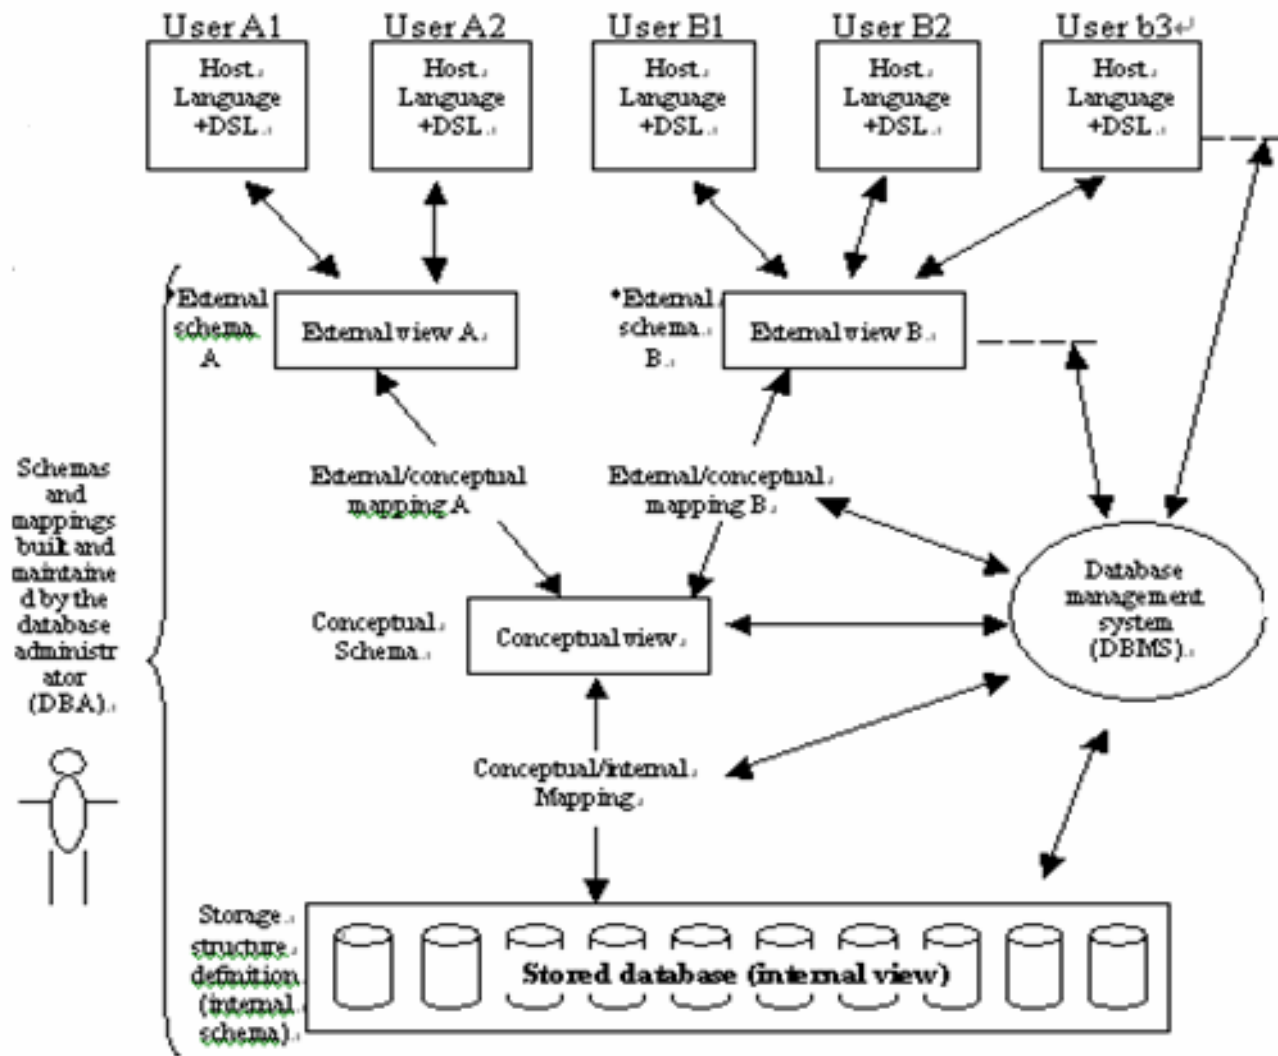

- ANSI/SPARC
Study Group on Data Base Management Systems
- Before
 - DBTG Report for network model in 1974

The three levels of the architecture

Example of the three levels

<p>External (<i>PL/I</i>)</p>	<p>DCL 1 EMPP 2 EMP# CHAR(6), 2 SAL FIXED BIN(31);</p>		<p>External (<i>COBOL</i>)</p>	<p>01 EMPC. 02 EMPNO PIC X(6) 02 DEPTNO PIC X(4)</p>											
<p>Conceptual</p>	<p>Employee</p> <table border="0"> <tr> <td><u>Employee number</u></td> <td>Character (6)</td> </tr> <tr> <td><u>Department number</u></td> <td>Character (4)</td> </tr> <tr> <td>Salary</td> <td>Numeric (5)</td> </tr> </table>					<u>Employee number</u>	Character (6)	<u>Department number</u>	Character (4)	Salary	Numeric (5)				
<u>Employee number</u>	Character (6)														
<u>Department number</u>	Character (4)														
Salary	Numeric (5)														
<p>Internal</p>	<table border="0"> <tr> <td>STORED_EMP</td> <td>BYTES=20</td> </tr> <tr> <td>PREFIX</td> <td>TYPE=BYTE(6),OFFSET=0</td> </tr> <tr> <td>EMP#</td> <td>TYPE=BYTE(6),OFFSET=6,INDEX=EMPX</td> </tr> <tr> <td>DEPT#</td> <td>TYPE=BYTE(4),OFFSET=12</td> </tr> <tr> <td>PAY</td> <td>TYPE=FULLWORD,OFFSET=16</td> </tr> </table>					STORED_EMP	BYTES=20	PREFIX	TYPE=BYTE(6),OFFSET=0	EMP#	TYPE=BYTE(6),OFFSET=6,INDEX=EMPX	DEPT#	TYPE=BYTE(4),OFFSET=12	PAY	TYPE=FULLWORD,OFFSET=16
STORED_EMP	BYTES=20														
PREFIX	TYPE=BYTE(6),OFFSET=0														
EMP#	TYPE=BYTE(6),OFFSET=6,INDEX=EMPX														
DEPT#	TYPE=BYTE(4),OFFSET=12														
PAY	TYPE=FULLWORD,OFFSET=16														

*User interface.

Fig.2.3 Detailed system architecture

External Level

- **Individual level**
- Each User has a language at his or her disposal (C++, Java ...)
- **Host language & Sub-Language**
 - Host language – C++, Java...
 - Sub-Language – DDL, DML
 - tightly coupled , loosely coupled
- **External Record & External Schema**

Conceptual Level

- **Conceptual View**
a representation of the **entire information content of the Database**
- **Conceptual Schema**
definition of the conceptual view
it include security and integrity constraints

Internal Level

- **Internal View**

a low-level representation of the entire database

it doesn't deal in term of physical record (block or page), nor with any device-specific considerations.

- **Internal Schema**

definition of the internal view

MAPPING

- **Conceptual/Internal mapping**
the key to **physical data independence**
- **External/Conceptual mapping**
the key to **logical data independence**

DBA

- Coordinates all the activities of the database system
- the database administrator has a good understanding of the enterprise's information resources and needs.

DBA – Cont.

- Database administrator's duties :
 - Schema definition (Logical Database Design)
 - Storage structure and access method definition
 - Schema and physical organization modification
 - Granting user authority to access the database

DBA – Cont.

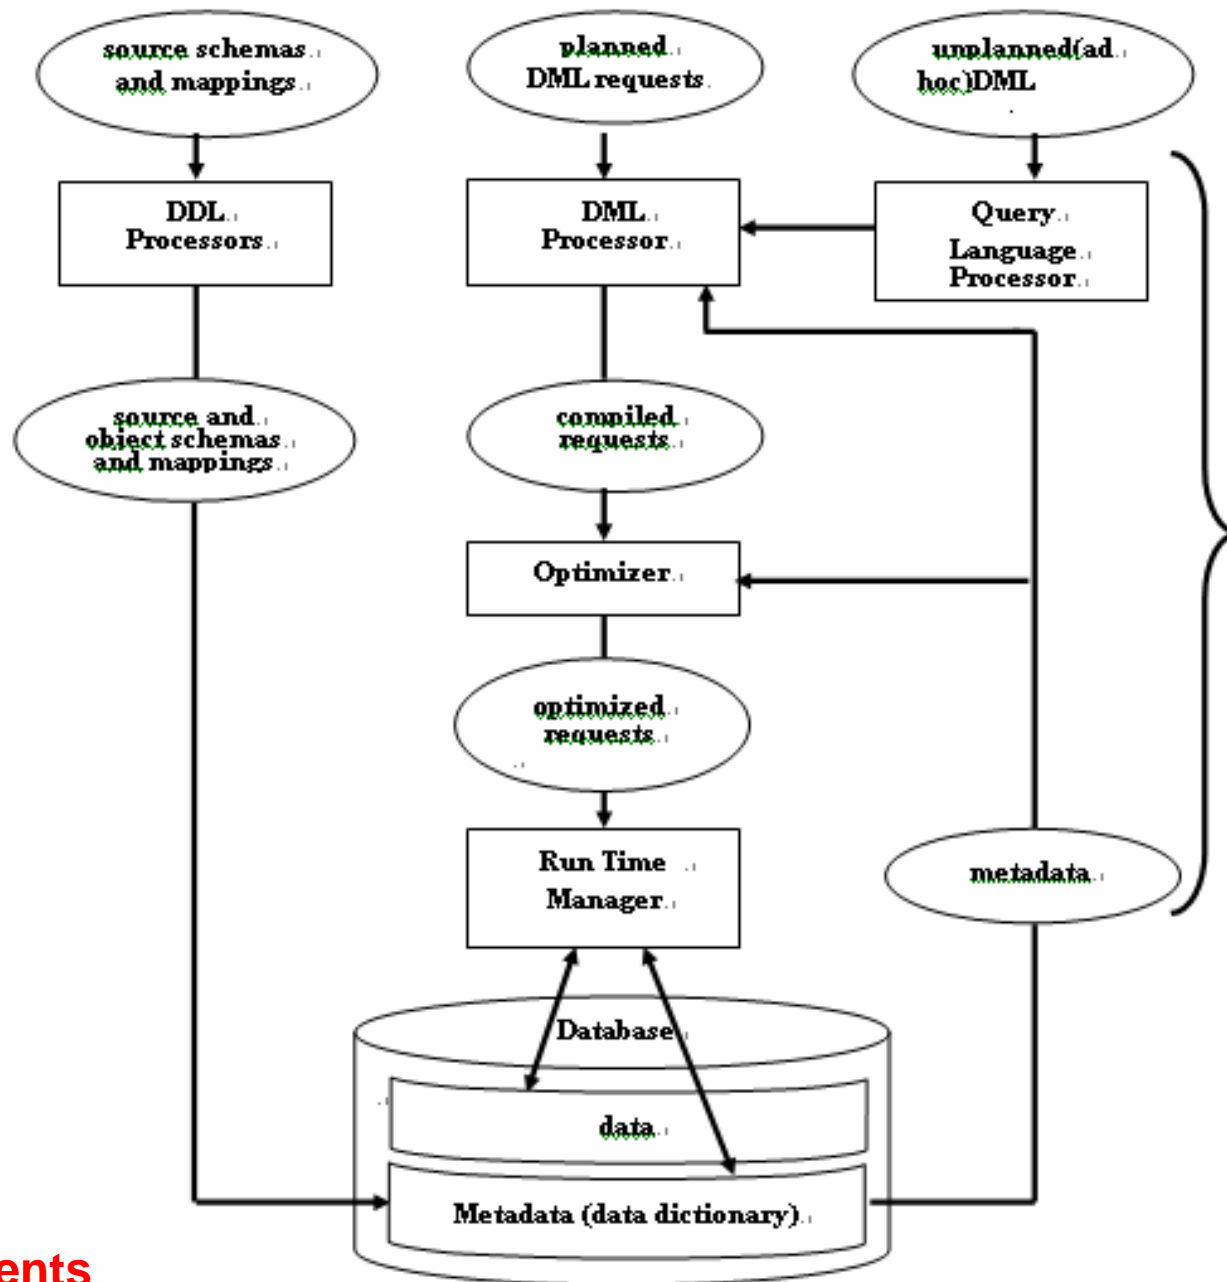

- Specifying integrity constraints
- Acting as liaison with users
- Defining dump & reload policies
- Monitoring performance and responding to changes in requirements

DBMS

- **Software** - handles all access to the Database
 - Data definition
 - Data manipulation
 - DML request (planned/unplanned)

DBMS-cont.

- Optimization & execution
- Data security & integrity
- Data recovery & concurrency
- Data dictionary
- Performance

**DBMS
Components**

DBMS - Cont.

- File management system
 - not aware internal structure of stored record
 - little or not security & integrity support
 - little or not recovery & concurrency control
 - no true dictionary
 - less data independence
 - not integrated or shared

C/S Architecture

- **Server**

DBMS itself

- **Client**

various applications that run on top of the DBMS

- **User - written application**

- **Vendor - Provided application (tools)**

Report writer, Spreadsheet, Statistical package....

C/S Architecture

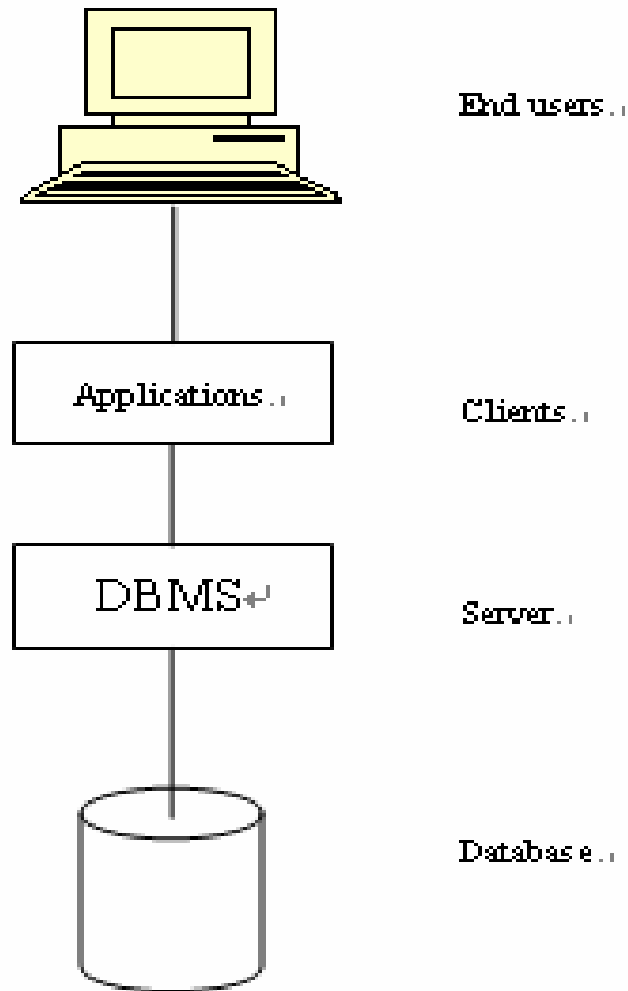

Fig.2.5 Client/server architecture

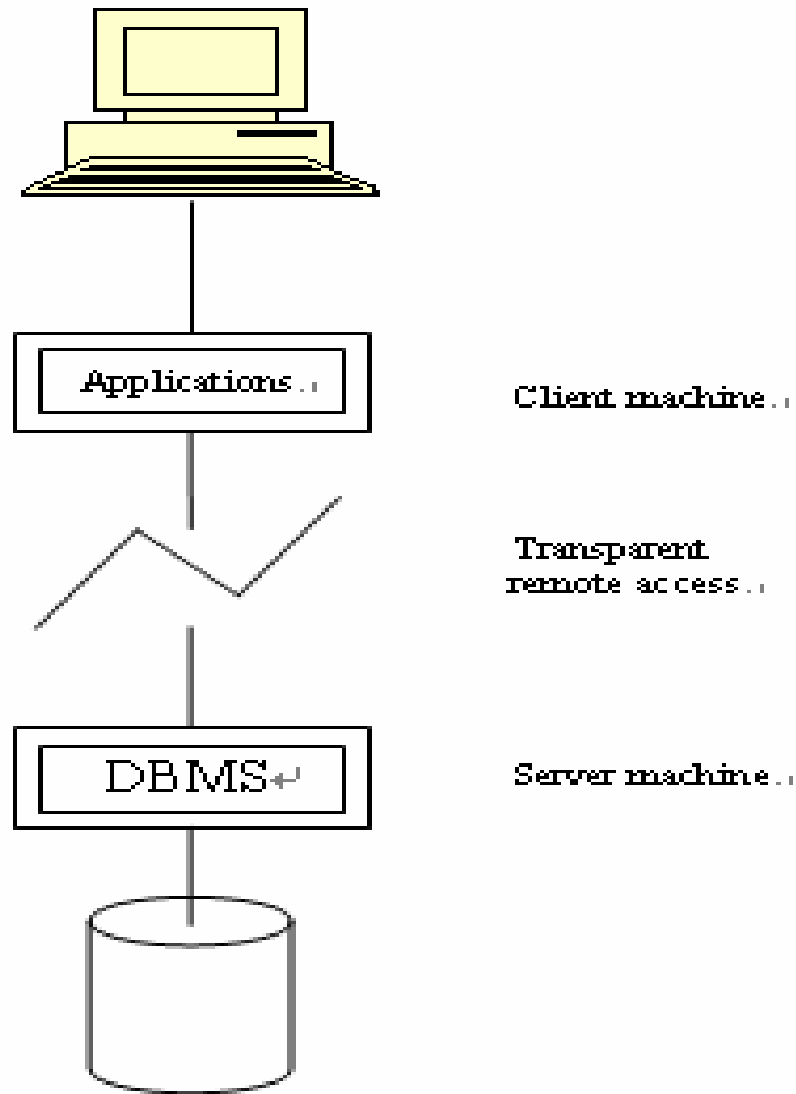

Fig.2.6 Client(s) and server running on different machines . .

Fig. 2.7 One server machine, many client machines

+

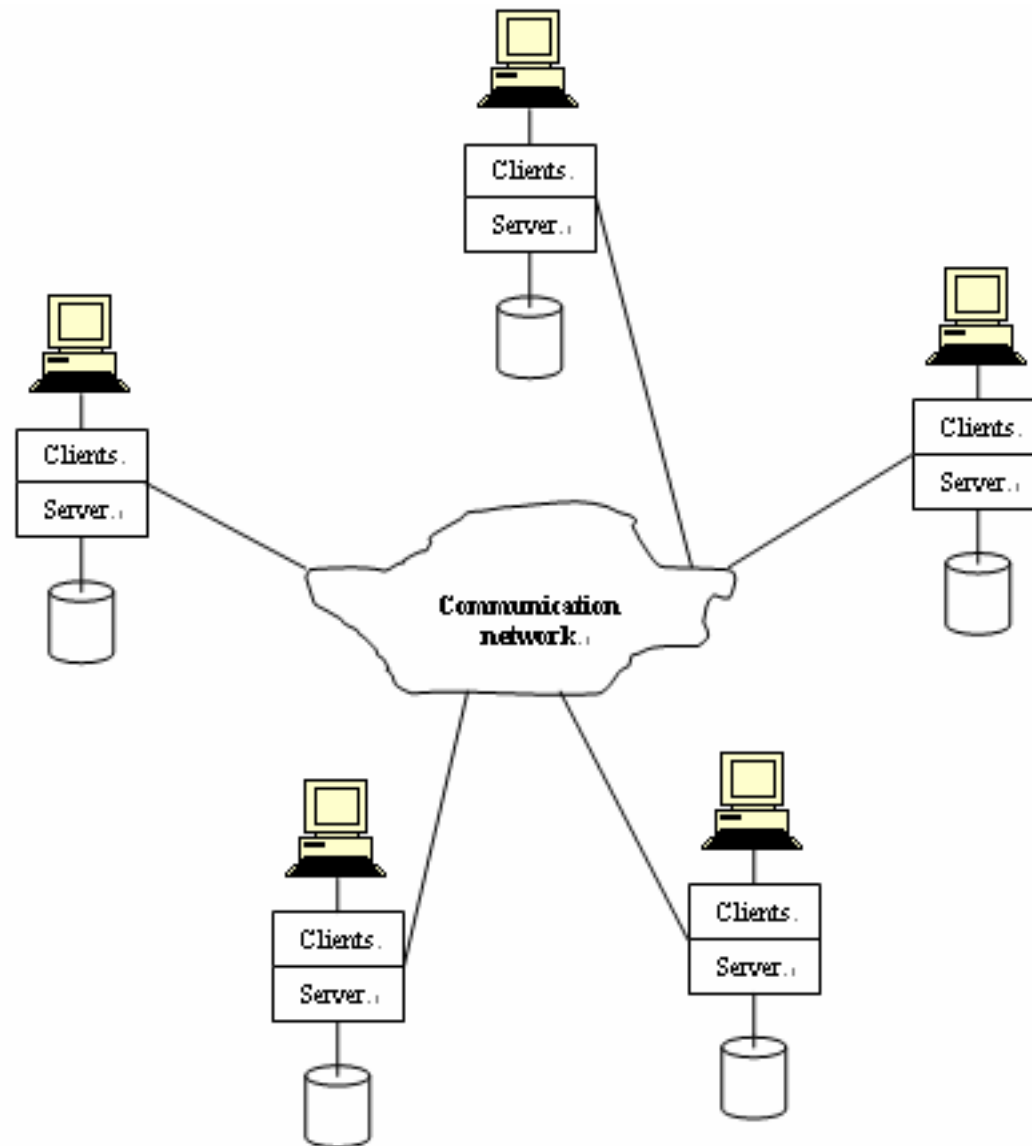

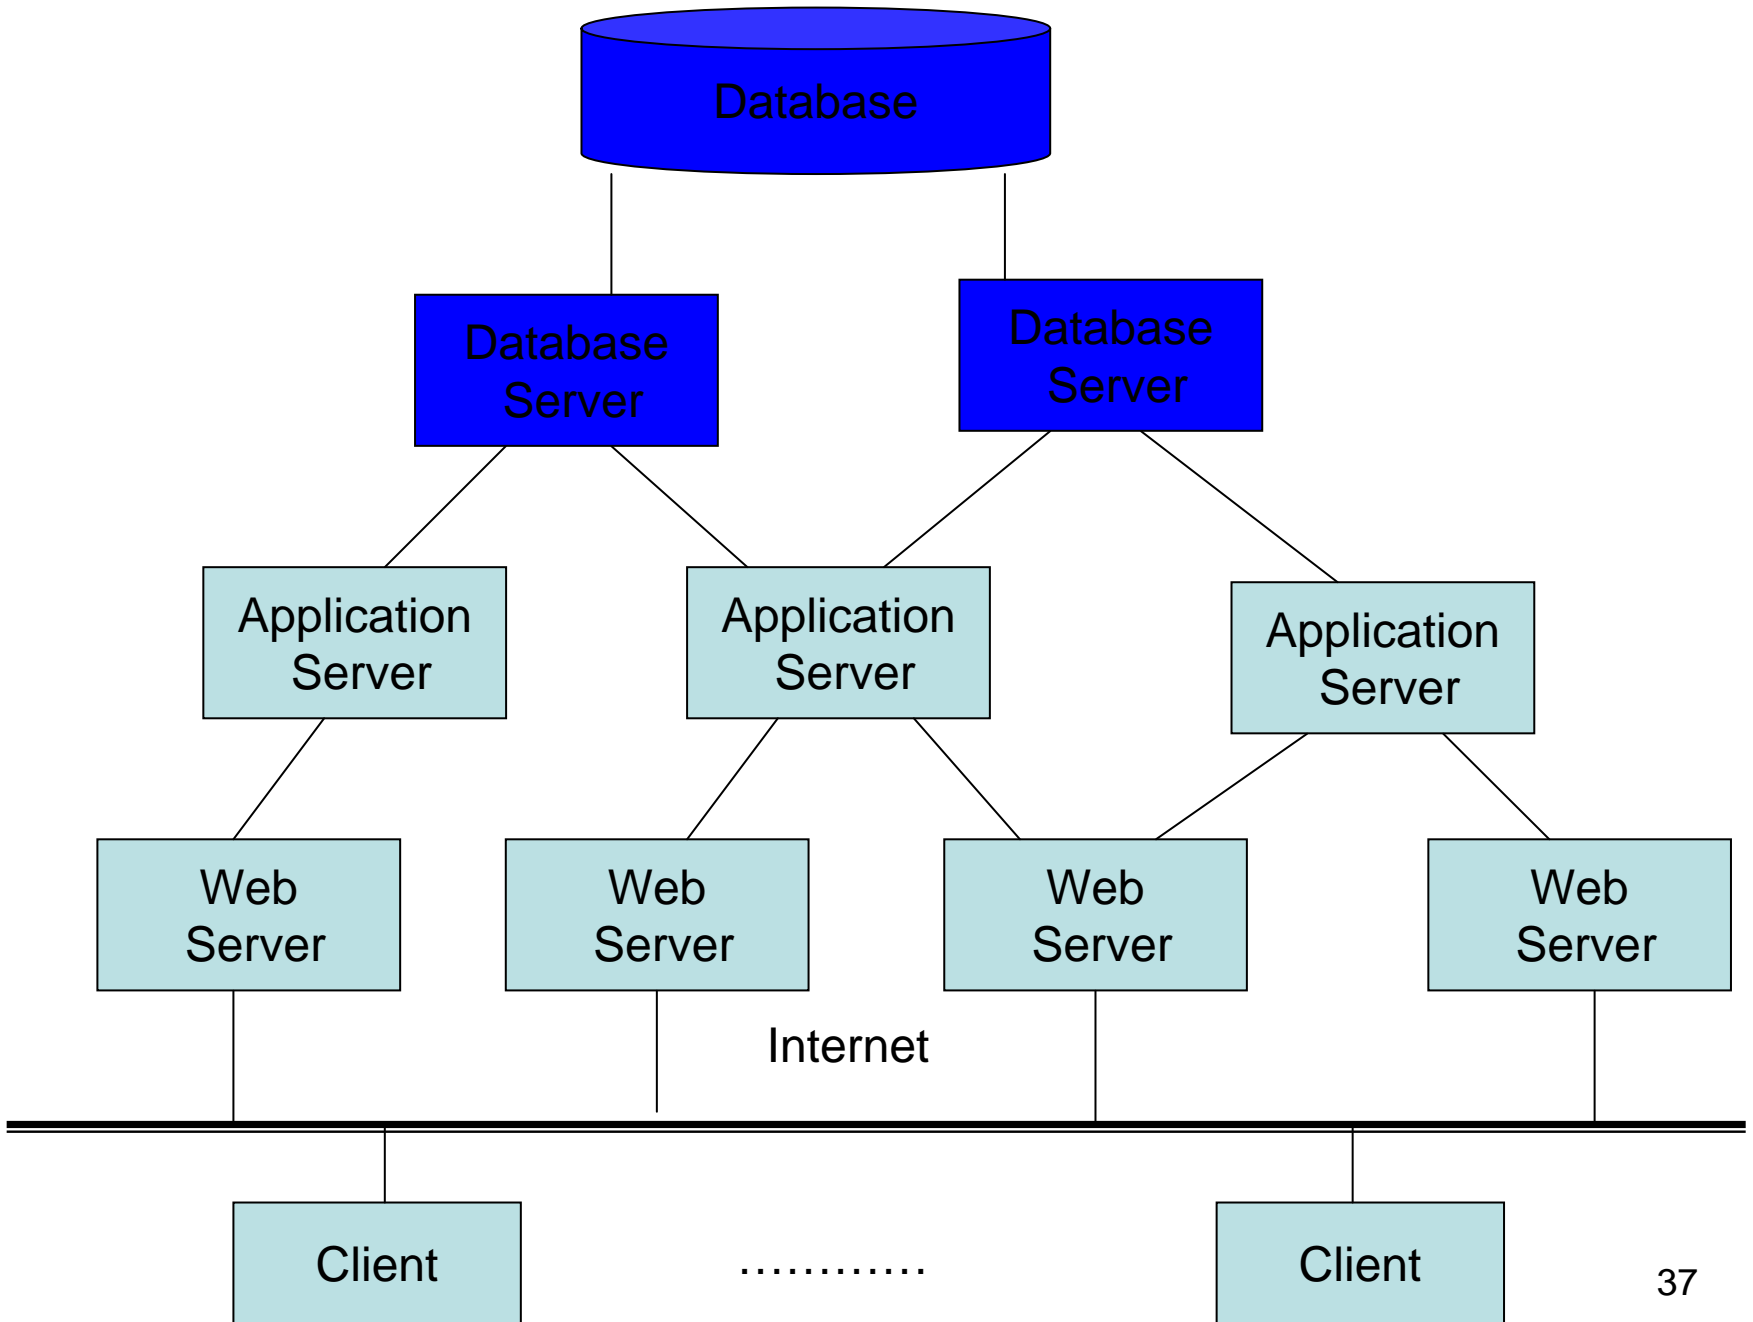

Fig. 2.8 Each machine runs both client(s) and server.

B/S Architecture

- Three-Tier Architecture
 - Web Server
 - Connect client to the database system, usually over the Internet or possibly a local connection
 - Application Server
 - Perform the “business logical”, whatever it is the system is intended to do
 - Database Server
 - Run the DBMS and perform queries and modifications at the request of the application server

Utilities

- load
- Unload/reload
- reorganization
- Statistics
- Analysis

Data Access process

- Issue a read request from program
- DBMS intercept and analyze it
- DBMS access three level schemas and two mappings from Dictionary
- DBMS issue disk read request to OS
- OS issue read to disk and fetch correspond pages to buffer
- the Data passed to user work-space under DBMS
- DBMS return a state word to program

- Exercise
2.4, 2.5, 2.6
